Estimates of the modern water depth and reported palaeo-elevation are used to reconstruct the palaeo-RSL (reconstructed palaeo-sea-level). Uplift or subsidence is indicated by arrows and can affect the estimated palaeo-water depth. Modern corals are shown with depth ranges for taxa 1 and 2. LIG corals (Late Glacial Interval) are also indicated at different sea levels, with uplift/subsidence arrows showing changes in the present sea-level and modern coral depth range.
