

Database tables and relationships

(1) groups contain several embers and an ember can be in several groups ('many to many' relation). A few fields relate to the link itself, hence they are in table 'ember2embergroup'.

(2) "maingroup" is a default group for embers included in several groups (for use when the context does not indicate a specific group).

(3) The numerical data in an Axis relates to a variable (var_name_std). Each ember also has its own variable (haz_name_std): to include an ember in a figure, those variables must be identical, or a conversion rule must be used.
