Received and published: 17 September 2012

This is an very well-written paper about a global data set of ocean carbon dioxide. It covers basic information about Surface Ocean CO<sub>2</sub> Atlas (SOCAT), how the data set was assembled and processed, and how the data set is accessible to the public. I strongly recommend to publish the paper with only some minor technical corrections.

Minor suggestions to consider: 1) Based on equations on Page 748, only fCO<sub>2</sub> (at SST) is calculated. pCO<sub>2</sub> (at equilibrator temperature) was calculated, but not the pCO<sub>2</sub> (at SST). Should pCO<sub>2</sub> (at SST) also be reported? After all, some scientists do prefer pCO<sub>2</sub> to fCO<sub>2</sub>. 2) Is there a need to correct the temporal trends and normalize all fCO<sub>2</sub> to a specific year, just like what Taro Takahashi did to his data set?

Discussion Paper

Editorial: 1) Page 740, Line 15, 16: Most of the repeat hydrography studies are also surface observations. Clearly, here the authors were referring to time-series studies like those conducted on a mooring. I recommend to replace "surface ocean CO2 observations" with "time-series CO2 observations".

2) Page 748, Eq (3): please also explain the term X2 wet Teq.
