

Review of

WHU-SGCC: A novel approach for blending daily satellite (CHIRP) and precipitation observations over the Jinsha River Basin

This is my second review of the manuscript. Compared to the first version the authors have substantially improved the manuscript. They extended the data base and performed a more sophisticated analyses to obtain statistically robust results. They have taken all my suggestions into account. Therefore, I recommend publishing the manuscript after addressing a few minor issues:

- L.49-50: Use the plural form of the verbs in this sentence.
- L.199-210: Please provide a bit more detail about the random forest regression and the bootstrapping used in the study!
- L.357-364: This part is difficult to understand. Please perform a language check and rephrase this part.
- L401: shown → showed
- Figure 5: The labelling (a,b,c,...) is missing in the subfigures.
- L.417: It should be Table 6 here, not Table 5.
- L.453: I guess, it is supposed to be “elevation” instead of “evaluation”?
- L.561: ...by approximately by... → ..by approximately...
- L.466-468: What is the typical daily rainfall amount in during the monsoon season? Considering, that the proposed method doesn't perform very well in case of heavy precipitation, it might not be the appropriate tool for monitoring monsoon precipitation.
