1 EDGARv4 geographical data

All countries of the world are taken up in the EDGAR database, except South and North Sudan (grouped together), Liechtenstein (grouped with Switzerland), Monaco (grouped with France), Andorra (grouped with Spain) and Vatican/San Marino (grouped with Italy). The countries are clearly defined with names recognized by the European Commission and present each a Party for the UNFCCC. All countries can be uniquely allocated to one of the three groups that were present at the creation of the UNFCCC: the 24 countries of the OECD in 1990, the 16 countries with Economies in Transition (EIT) (both form the Annex I countries of 1992) and the rest are the non-Annex I countries. Detailed information is not for each country available in the global database and neighbouring countries are assumed to show e.g. similar technologies. As such 24 geographical groups of countries have been defined and are used for e.g. the allocation of the type of vehicles. These 24 groups are also used in IPCC AR6 scenarios run with the IMAGE land-use model. Finally, for the temporal distribution, only three groups of countries are considered, depending on the temperate zone they are located: northern zone, equator and southern zone. All these characteristics of the countries are summarized in Table S1.

Table S1: List of countries with their ISO_A3 codes and characteristics w.r.t. historical group (24OECD(1990) or 16EIT(1990) or non-Annex I), w.r.t temperate climatic zone (determining the temporal profile) and w.r.t. the geographical 24 groups of neighbouring countries that are assumed to use similar technologies.

Name	ISO_A3 code	geographical group	temperate zone	historical group
Afghanistan	AFG	18:_India +	01:_Northern Temperate Zone	Non-Annex_I

2 EDGARv4 human activities

The sector-specific structure of the EDGAR database consists of 26 main sectors (characterized with the first three letter codes), which are further subdivided in subsectors, depending on the type of technology (see Table S3). In addition EDGARv4 uses the same fuel types as IEA and the same livestock and crop types as FAO. The fuel types are for the sake of clarity presented in Table S2 following the main categories of IPCC (2006) guidelines.

Table S2: Different types of fuel (based on IEA definitions), which are grouped in IPCC (2006) guidelines' categories and applied as such in EDGARv4.3.2.

Fuel Category	Fuel Description	code	Comment
SOLID FOSSIL FUELS			<i>(CO2 long cycle)</i>
Hard coal	Anthracite	ANT	Anthracite
Hard coal	Other Bituminous Coal	BTC	Bituminous
Hard coal	Coking Coal	CKC	Bituminous
Hard coal	Coal Tar	CLT	Coal product <i>(for non-energy use)</i>
Hard coal	Gas Coke	GCK	Coal product
Hard coal	Hard Coal (if no detail)	HDC	
Hard coal	Coke Oven Coke	OCK	Coal product
Hard coal	Patent Fuel	PAT	Coal product
Hard coal	Sub-Bituminous Coal	SBC	Sub-bituminous
Brown coal	BKB/Peat Briquettes	BKB	Coal product
Brown coal	Brown Coal (if no detail)	BRC	Lignite
Brown coal	Lignite/Brown Coal	LGN	Lignite
Peat	Peat	PEA	Peat or under Brown coal
Solid waste	Municipal Waste (Non-Renew)	MWN	Non-biomass
FOSSIL OIL AND OIL PRODUCTS			
Heavy oils	Bitumen	BIT	<i>for non-energy use</i>
Heavy oils	Crude/NGL/Feedstocks (if no detail)	CNF	Crude subtype
Heavy oils	Crude Oil	CRU	
Heavy oils	Gas/Diesel Oil	DIE	diesel
Heavy oils	Residual Fuel Oil	HFO	
Heavy oils	Lubricants	LUB	<i>for non-energy use</i>
Heavy oils	Other Hydrocarbons	NCR	
Heavy oils	Petroleum Coke	PCK	<i>for non-energy use</i>
Heavy oils	Paraffin Waxes	PWX	<i>for non-energy use</i>
Heavy oils	Refinery Feedstocks	RFD	Crude subtype
Light oils	Additives/Blending Components	ADD	Crude subtype
Light oils	Aviation Gasoline	AVG	
Light oils	Ethane	ETH	
Light oils	Gasoline Type Jet Fuel	GJE	
Light oils	Kerosene Type Jet Fuel	JET	
Light oils	Liquefied Petroleum Gases (LPG)	LPG	
Light oils	Motor Gasoline	MOG	Petrol
Light oils	Naphtha	NAP	<i>for non-energy use</i>
Light oils	Natural Gas Liquids	NGL	Crude subtype
Light oils	Kerosene	OKE	
Light oils	Non-specified Petroleum Products	OPR	
Light oils	White Spirit & SBP	WSP	for NEU

GASEOUS FOSSIL FUELS			
Natural gas	Natural Gas	NGS	
Derived gases	Blast Furnace Gas	BFG	Coal product
Derived gases	Gas Works Gas	GGG	Coal product
Derived gases	Elec/Heat Output from Non-spec. Manuf. Gases	MNG	Miscellaneous fossil fuel product
Derived gases	Coke Oven Gas	OGS	Coal product
Derived gases	Refinery Gas	RGS	Oil product
Derived gases	Oxygen Steel Furnace Gas	SGS	Coal product
BIOMASS FUELS			(CO2 short cycle)
Solid biomass	Charcoal	CHA	Wood product
Solid biomass	Dung	DNG	
Solid biomass	Industrial Waste	IWS	Waste
Solid biomass	Municipal Waste (Renew)	MWR	Waste
Solid biomass	Non-specified Combust. Renewables + Wastes	NSF	
Solid biomass	Primary Solid Biomass (non-specified)	SBI	
Solid biomass	Vegetal waste	VWS	
Solid biomass	Wood	WOD	
Liquid biomass	Biodiesel	BDS	
Liquid biomass	Biogasoline	BGL	
Liquid biomass	Bagasse	BGS	Sugar cane product
Liquid biomass	Black Liquor	BLI	Pulp product
Liquid biomass	Liquid Biomass	LBI	Bioethanol, biodiesel
Liquid biomass	Other Liquid Biofuels	OLB	
Gaseous biomass	Biogas	GBI	Landfills, Waste Water Treatment plant, digester

Table S3: Source categories used in EDGARv4.3.2. These include the main category with all Source/Sink Categories conform with the common reporting format of the IPCC (1996) and IPCC (2006) Guidelines. Note that neither large scale biomass burning nor land-use, land-use change and forestry emissions are included, although we do include agricultural activities (such as livestock and milk production, crop and rice production, agricultural waste burning, field burning, histosols and liming).

5

sector	Sector description	Detail	Detailed description	IPCC (1996)	IPCC (2006)
AGS	Agricultural soils	AGS.ANW AGS.BFL, CHC, CML, CTT, DCK, GTS, HRS, PGS, SHP, SSS, TRK	Animal Manure Applied to Soils	4D12	3.C.4
AGS	Agricultural soils		Pasture, Range and Paddock Manure	4D2	3.C.4
AGS	Agricultural soils	AGS.CRP	Crop Residue	4D14	3.C.4

3 EDGARv4 temporal and spatial distribution

A key proxy dataset is the gridded world population provided by the Center for International Earth Science Information Network (CIESIN, 2005 and updated in 2011) for the years 1990, 1995, 2000, 2005, 2010 and projected to 2015. In-house proxy datasets are developed by dividing the total population into rural and urban. These data are applied in order to cover the country area and population and take into account the fraction of country data in cells with an intersection of the country's borders.

For the agricultural emission sources with diffuse areal distribution, agricultural land use and soil type maps, such as grassland and cropland cover datasets, rice cultivation area and animal density maps from FAO Geonetwork (2011, 2014) and Monfreda et al. (2008) are used. Coastal fishing activities are distributed on the artisanal fishing map of Halpern et al. (2015).

Industrial activities (power plants, oil refineries, mines) are mainly located at the plant location coordinates on the point source grid-maps. Power plant emissions have been distributed according to the CARMAv3.0 (2012) point source distribution making use of the CARMAv3.0 intensity parameter and differentiating three fuel types (coal, gas and oil). CARMA's point sources with low intensity are used to allocate emissions from auto-producing power or heat plants. A specific proxy was developed for the non-metallic minerals production (mainly cement and lime) for the world leading producers of cement (i.e. Brasil, USA, China and India) based on the plant locations and annual throughput of the facility listed by the CEC (2015) for China, Canada and Mexico, EPRTR (2012) v4.2 for Europe and USGS (2016) and IndustryAbout.com (2016) for the rest of the world.

Because of the incompleteness of the list of cement factories (in particular also those with smaller throughput), the country total is not fully distributed over the single reported point sources. Instead annual emission estimates per facility were applied. The difference between the total of the facility emissions and the country total of the given sector is distributed using urban population data. Gas flaring activities are distributed on NOAA's night-time light data (Elvidge et al., 2009) for those areas of Central America, Nigeria and Western Africa, the North Sea region, Middle East and Russia with strong gas flaring activities. For the major coal producers (i.e., China, USA and Southern Africa) the coordinates of coal mines from the World Coal Association (2016) are used to distribute emissions from underground and surface coal mines, also distinguishing between hard and brown coal. Coal mine locations for China have been updated and extended with the data of Liu et al. (2015).

Line sources are exclusively used to describe emissions from the transport sector. Different proxy data layers for three road types worldwide (highways, primary and secondary, residential and commercial roads) obtained from the OpenStreetMap of Geofabrik (2015) are used with different weighting factors for the emission distribution, depending on the type of vehicles circulating on the different types of roads. Similar data from OpenRailwayMap are used for railways. For inland waterways the maritime traffic lines (for ships and ferries) are composed from the navigable parts of rivers and lakes, using the InlandWaterwaysMap of the US Department of Transport US DoT (2015) for the USA, the UNECE Waterway network (2015) for Europe and the hydrology map of Lehner et al. (2011) for the rest of the world. Wang et al. (2008) is used for international shipping, updated for the Mediterranean, Black and Baltic Sea with Long Range Identification and Tracking data from the European Maritime Safety Agency, as described in Trombetti et al. (2017). The spatial proxy for the aviation sector is derived from International Civil Aviation Organization (ICAO, 2015) flight information and is specified at three different heights: takeoff/landing, climb-out/descending and cruise (see Fig. S1 in the Supplementary). ICAO (2015) specifies a typical flight pattern with landing/take-off cycle within few km of the airport, followed by climb-out/descending phase during the first 100 km and the last 100km of a flight and finally the remaining part from km 101 until the last 101 km as the cruise phase. Input data regarding airports and routes used in this approach are taken from Airline Route Mapper of ICAO (2015). Civil supersonic aviation using the Franco-British Concorde between 1976 and 2003 and the Russian Tupolev TU-144 between 1970 and 1983 are also included.

Each of the EDGAR human activities (at subsector level) is uniquely coupled to one temporal profile and one spatial distribution profile. The temporal profiles are given in Table S4a and the spatial profiles in Table S4b. These profiles have been collected, reviewed with our QA/QC procedure and refined over many years. The largest variation is found in the temporal profiles from Asman (1992) for the agricultural sector (Fig. S2a). A smaller modulation in emissions from residential heating is seen in the temporal profiles of Friedrich and Reis (2004), while the modulation of the power generation sector is from Veldt (1992), both updated by Thiruchitampalam (2012). For the monthly distribution of shipping emissions, the profile of Wang et al. (2008) is applied while aviation is distributed with the temporal profile of the AERO2K project of Eyers et al. (2004). Therefore the underlying source of information is given at our best knowledge with the reference in the tables which are a mix of data sources with hyperlinks and literature references.

Table S4a – List of temporal profiles to which the human activities are allocated in EDGARv4.3.2 for monthly distribution. The data source provides the literature reference, in which these underlying proxies are described.

Geographical zone	Sector	Subsector	temporal profile	Data source	
Northern temperate zone	energy	Power industry	based on LOTOS	Veldt (1992), Builtjes (1992)	
	Waste	solid waste and waste water	Constant

Table S4b – List of spatial proxy data that are in EDGARv4.3.2 applied to spatially distribute the national totals. The reference provides either the literature reference or the hyperlink where these underlying data can be found. All these spatial proxy datasets are modified to fit within the gridding algorithm of EDGARv4.3.2 and often combine different sources when no global coverage was obtained with the proxy data.

EDGAR sector	Sector description	Gridmaps	Reference
AGS	Agricultural soils	Animals: buffaloes, cattles, chickens, ducks, goats, pigs, poultry, sheeps	livestock: http://livestock.geo-wiki.org/ buffaloes: http://www.fao.org/AG/AGInfo/resources/en/glw/GLW_dens.html

The distribution of the country totals for a given sector over the different grid cells of the country occurs, where needed, with technology-specific and time-dependent proxy data f_{ij} (in formula (2)):

- For road transport, technology-dependence is highly important, to reflect the traffic of passenger cars but no heavy duty vehicles on residential roads, but both on highways. The OpenstreetMap has been downloaded for all parts of the globe with the 4 different types of roads. For each vehicle type in EDGARv4 (motorcycles, mopeds, passenger cars, light duty vehicles, heavy duty vehicles and busses) a proxy dataset is composed with the appropriate roads (max. 4 out of the 4) on which the given type of vehicles are mainly running. The proxy data does not vary over time, but the shares of the different vehicles do vary over time and as such a time variation is obtained in the road transport emissions distribution.

5

10

- For power plants, no technology-dependence is available in the proxy datasets, but fuel- and time-dependence, given by the CARMAv3.0 datasets (2004, 2007, future). After a standard QA/QC screening with gapfilling of missing (0,0) plant coordinates, correcting inverted (lon,lat) coordinates and adding some additional points for Russia, the proxy data were used for 2004 (covering the period up to 2005), for 2007 (covering the period 2006-2010) and for future (covering the period 2011-2012). With the given carbon-intensity, a differentiation between coal, oil and gas power plants could be made, so that the distribution of the power plant emissions can be done while keeping the fuel characteristics. The capacity is used to vary the strength of the point sources relatively within the same fuel category. For larger countries (e.g. USA) with a non-uniform distribution of coal power plants, this was considered a significant improvement. There is a high uncertainty in using the capacity for the actual strength of the point source. However, plant information data is sensitive and the CARMAv3.0 provides the desired input for a global picture. In the future, satellite data might help to complete that picture, as illustrated by Nassar et al. (2017).

15 Figure S1 – EDGAR approach to distribute emissions from aviation over 4 different altitude ranges.

Figure S2 – a. Proxy data used in EDGARv4.3.2 to temporally distribute the annual emissions over 12 months.

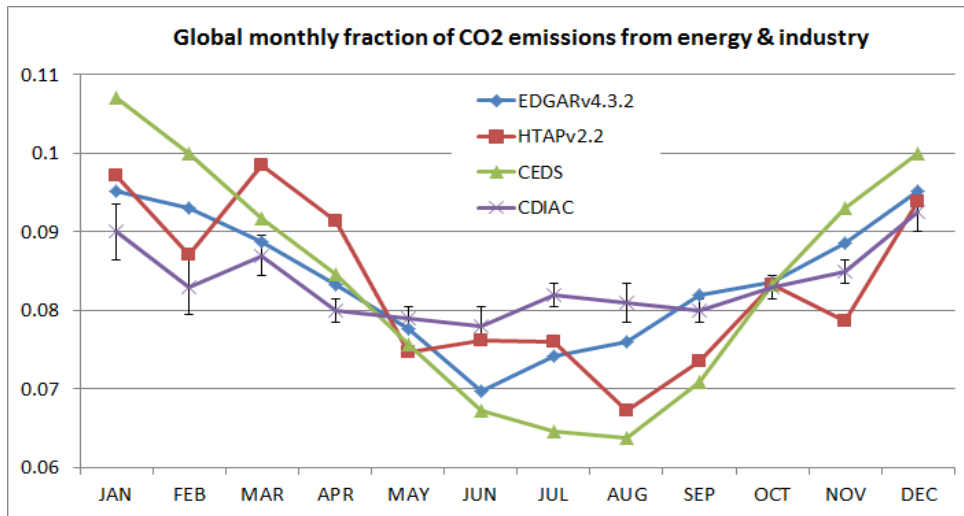

Fig. S2b: Comparison of the monthly fractions of CO₂ emissions from energy and industry applied by EDGARv4.3.2, with those derived by Andres et al. (2011) for CDIAC, Hoesly et al. (2018) for CEDS and Janssens-Maenhout et al. (2015) for HTAPv2.2.

5

4 Comparison of EDGARv4.3.2 to previous versions v4.2 and v4.1

Compared to former versions of the EDGAR database (e.g. EDGARv4.2, <http://edgar.jrc.ec.europa.eu/overview.php?v=42>), some emission factors have been updated, mostly for CH₄ on coal mining and N₂O on agricultural soils. This explains the differences in the comparison of the different EDGAR versions in Fig. S3.

10

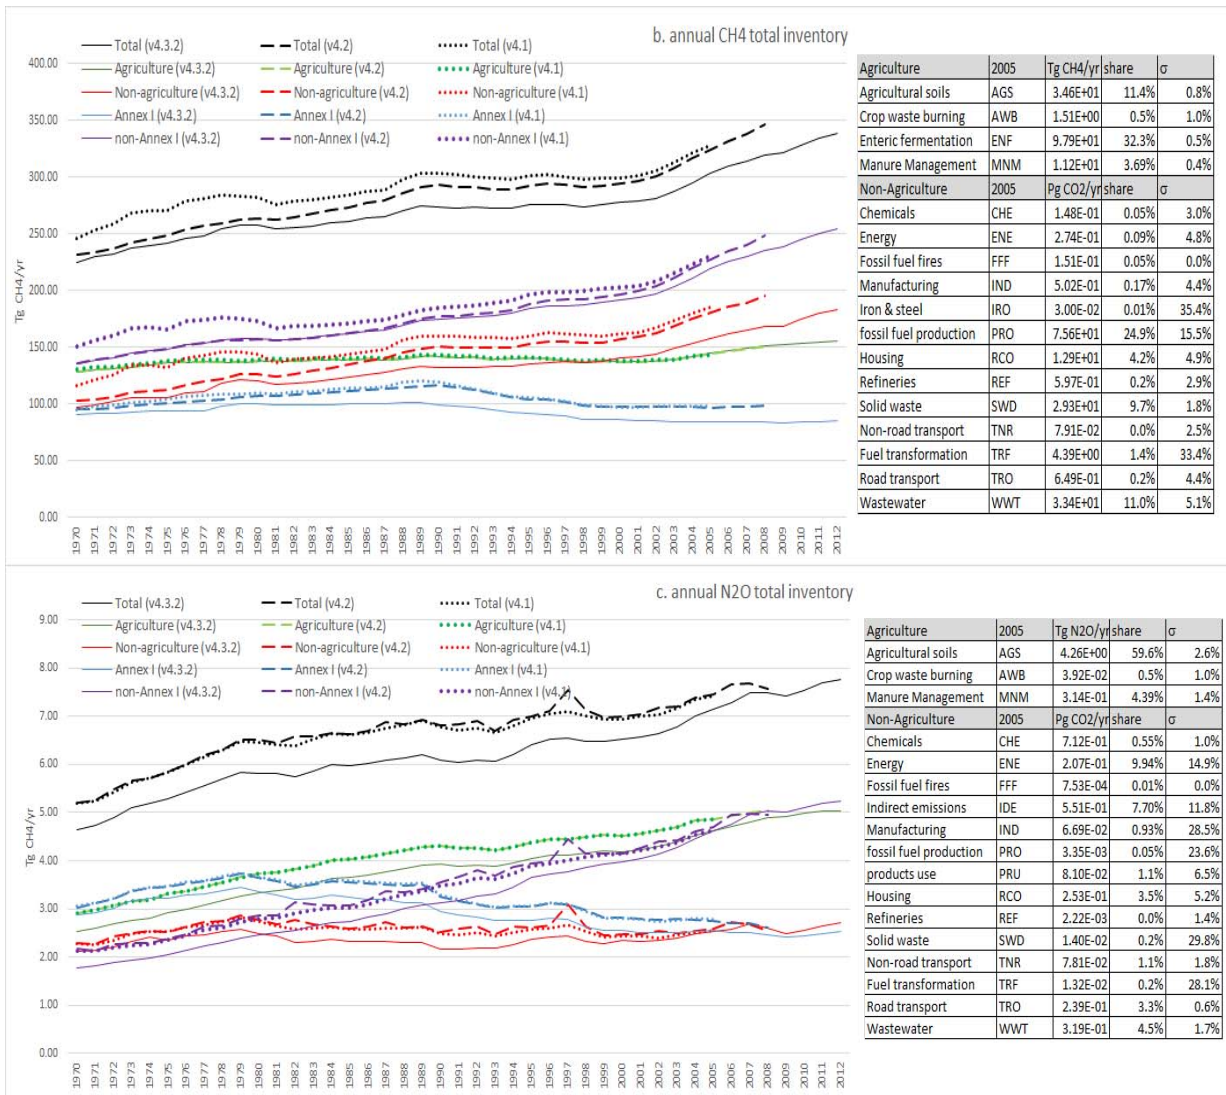

Figure S3: Comparison of v4.3.2 with previous EDGAR versions (v4.2 and v4.1) for CO₂ (a), CH₄ (b) and N₂O (c)

The largest improvement of the gridmaps is due to the significant update of the proxy data (see Table S4) to localise better the non-diffusive emissions. The new proxy data provided in particular a better and more appropriate representation of the road transportation activity with the 4 types of road in v4.3.2 (versus the generic „roads x population“ proxy in v4.2) for the transport by passenger cars. This allows to represent the volume traffic well, not only in Europe (as analysed by Thiruchitampalam, 2012) but also in the USA with sufficient weight the city connections (contrary to v4.2 as observed by Gately et al., 2017). The new proxy also works on a different road pattern for China and other developing regions, where road density and urban areas have a completely different pattern from the ones of industrialized countries. Also the power plants proxy from CARMA v3.0 yield a better and more appropriate representation of the power and heat generation activity, of which we did not only update the large power plant locations splitup by fuel type (coal, oil, gas) but we now included also the autoproducers and small scale electricity and heat production plants. In addition, the QA/QC procedures do not only check the completeness of the proxies but also the values over plant facilities.

5 Resulting trends for CO₂, CH₄ and N₂O per country group

In addition to the GHG trends for the three major regions in Fig. 4, the figures S4a, S4b and S4c present the three GHG separately for the same regions and countries: (i) non-Annex I countries with China, India, Brazil and Rest of non-Annex I countries, (ii) 24OECD90 countries with USA, EU15 and the remaining 8 OECD countries of 1990, (iii) 16EIT90 countries with Russia, EU13 and the remaining 2 newly independent Eurasian states. While Fig. S4a shows a similar trend as Fig. 4, this is not the case for Fig. S4b and S4c, where e.g. non-Annex I countries with significant agricultural activities and relative large uncertainties are important.

10 **Figure S4a: Annual CO₂ time series 1970-2012 of EDGARv4.3.2 with periodic error bar indication for the different types of countries with top emitters: China, India, Brasil, USA, EU-15, EU13, Russia and the rest of the non-Annex I countries, the rest of the OECD countries and the rest of the Eurasian states.**

Figure S4b: Annual CH₄ time series 1970-2012 of EDGARv4.3.2 with periodic error bar indication for the different types of countries with top emitters: China, India, Brasil, USA, EU-15, EU13, Russia and the rest of the non-Annex I countries, the rest of the OECD countries and the rest of the Eurasian states.

5

Figure S4c: Annual N₂O time series 1970-2012 of EDGARv4.3.2 with periodic error bar indication for the different types of countries with top emitters: China, India, Brasil, USA, EU-15, EU13, Russia and the rest of the non-Annex I countries, the rest of the OECD countries and the rest of the Eurasian states.

10

6 Resulting grid-maps of CO₂ - addition

The grid-maps of CO₂ presented in Fig. 9, 10 and 11 include both the short- and long-cycle carbon. For the buildings and road transport sector, it is interesting to look at the emissions difference for the long- and short-cycle carbon CO₂ separately. Figures S5a and S5b present the buildings sector for the long-cycle carbon CO₂ (from the combustion of fossil fuel) and respectively the short-cycle carbon CO₂ (from combustion of biofuel such as wood, wood waste, vegetal waste, dung, which are important for e.g. India). While the combustion of fossil fuel increased in Asia (India and China) considerably, the consumption of biofuel in the residential sector is partially decreasing, particularly in highly populated areas. Figures S5c and S5d present the transport sector for the long-cycle carbon CO₂ (mainly from combustion of diesel, petrol, gas) and the short-cycle carbon CO₂ respectively (from combustion of biodiesel and biogasoline). The trend of increasing fuel consumption for road transport is almost globally strongly present for the fossil fuel, while the biofuel consumption in road transport remains limited so far (except for Brasil).

15 **Figure S5a: Difference between 2012 and 1970 in long-cycle carbon CO₂ emissions from the buildings sector (combustion of fossil fuel for heating, cooling and equipping buildings, including also lighting and cooking).**

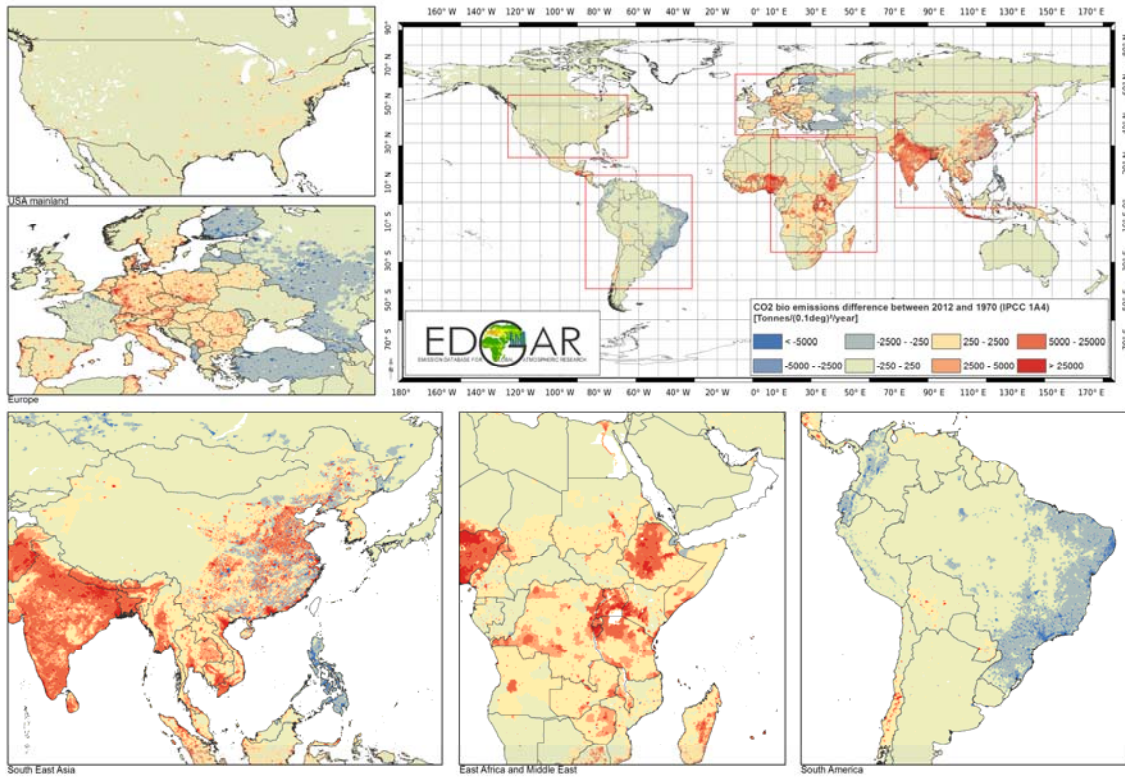

Figure S5b: Difference between 2012 and 1970 in short-cycle carbon CO₂ emissions from the buildings sector (combustion of biofuel, vegetal waste, wood waste, dung, wood for heating and cooking).

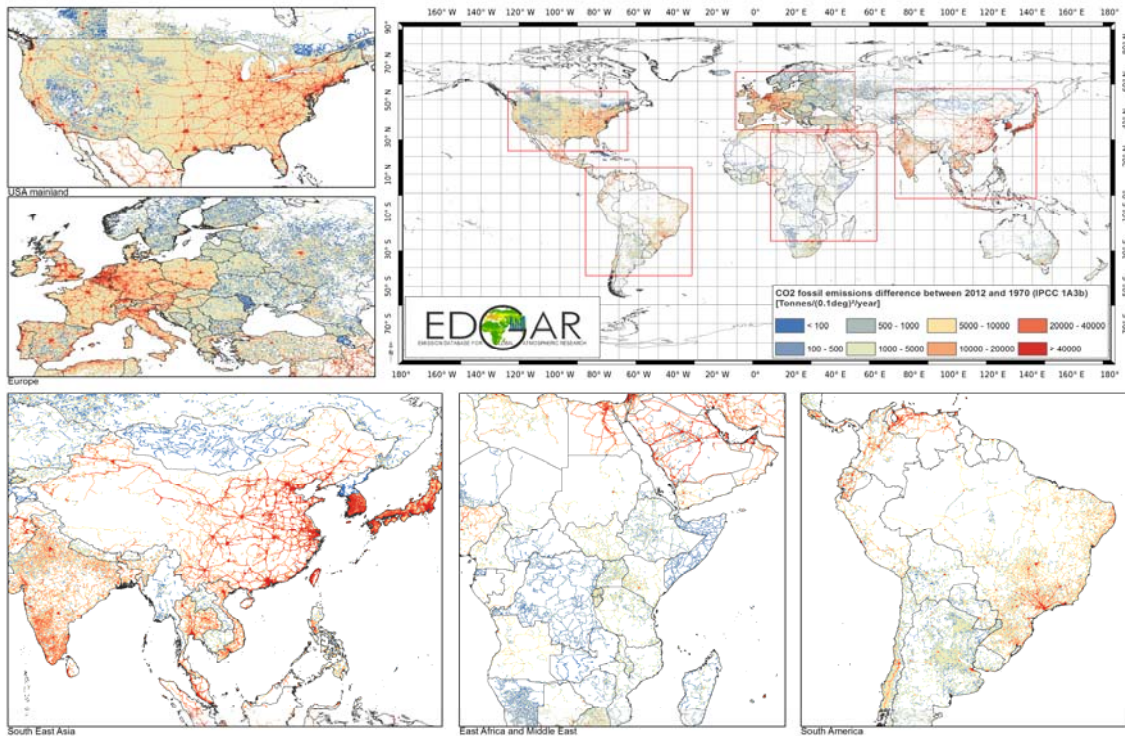

Figure S5c: Difference between 2012 and 1970 in long-cycle carbon CO₂ emissions from the transport sector (consumption of diesel, petrol, gas by vehicles for road transport).

5

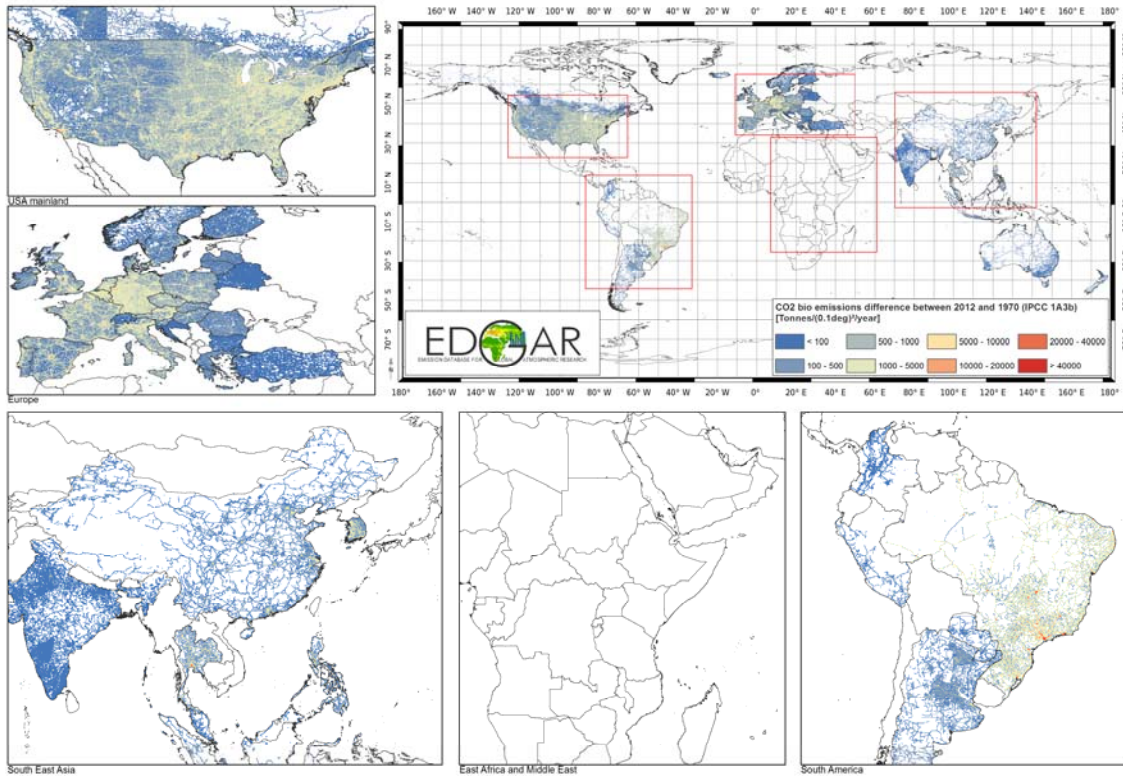

Figure S5d: Difference between 2012 and 1970 in short-cycle carbon CO₂ emissions from the transport sector (consumption of biodiesel or biogasoline in vehicles).

5

The sensitivity of the spatial distribution in the gridmaps is not negligible and subject to investigation in the H2020 project CHE. However, the atmospheric modeling community has been using EDGARv4, as shown in Table S5 and feedback has been taken up in the v4.3.2 version.

10

Table S5 – Non-exhaustive list of examples of EDGARv4 uptake by the atmospheric modeling community.
