Received and published: 24 April 2018

This manuscript presents a good reference for an extense dataset of cloud base height (CBH)measurements by ceilometer. CBH is a very important measure to estimate the downwelling longwave irradiance at the surface. This magnitude is mentioned in the mansucrypt insection 3.1. It would be interesting include the specifications of the instruments (upwelling and donwelling) used. I would also suggest to include this magnitude averaged for cloudy cases in Figure 5. Additionally, because there are measurements from satellite (CALIPSO ans CloudSat), I would suggest to compare for the available cases or at least some cases, the CBH measured from the ceilometer to those measured from CALIPSO and CloudSat.
