I consider the paper very interesting and the information presented very usefully. Some minor issues must be addressed before accepting this paper. Please, check my attached pdf and answer my questions. Some general questions: 1. How do you pretend to promote this paper? database? Courses? Meetings? 2. I consider that you should be really strict checking the homogenisation of the database. My big concern always is standardisation. I am very sad and disappointed when I use a database and for example, soil classification for each area is different, not updated or with not enough precision, I mean, order or sub-order. How do you pretend to correct that?
