General Comment:

A 30-meter resolution national urban land-cover data-set of China, 2000–2015 will give opportunity to conduct interesting research related to the topic of urban climate and the contribution of the land use land cover change including historical urbanization in the climate evolution at regional scale.

Response:

Yes, this product will be valuable for many applications such as urban climate and environmental analysis. We added texts in the Introduction section to indicate potential applications.
