

Interactive comment on “Ship-borne measurements of XCO₂, XCH₄, and XCO above the Pacific Ocean and comparison to CAMS atmospheric analyses and S5P/TROPOMI” by Marvin Knapp et al.

Anonymous Referee #2

Received and published: 29 September 2020

Knapp et al's manuscript "Ship-borne measurements of XCO₂, XCH₄, and XCO above the Pacific Ocean and comparison to CAMS atmospheric analyses and S5P/TROPOMI" is an excellent piece of work describing ship borne measurements of total-column CO₂, CO, and CH₄ gathered during a transect across the Pacific Ocean at ~30 deg N. There is a focus on the technical aspects of protecting and successfully deploying a solar-observing Fourier Transform Spectrometer in this challenging environment. There is also a satisfactory description of the trace gas retrieval process and bias correction efforts. Comparisons to both TROPOMI satellite observations, as well

as to CAMS model fields, are also described in detail. As the ocean environment is a measurement poor region for validation of our global models, this work is significant and very worthy of publication following a few minor technical corrections listed below.

The EM27/SUN data is made available by the authors; however, this reviewer struggled to quickly locate and download the exact CAMS product used for both the retrieval a priori and for the final comparison. If this was a special product produced for this campaign then that should be stated clearly and the data should be archived along with the EM27/SUN measurements. Or, if the model fields used are a standard product that I simply overlooked, I suggest including a link to the exact data.

Technical corrections:

L10: is found TO BE 0.24 ppm

L45: Agree with Reviewer #1 – change "disposes of"

L101: I assume the authors are stating that the ventilation takes up 160W when the electronics are running at full power? – this should be made clearer if so.

L147: Is the factor of 0.9693 simply an empirical correction? Is there a physical justification for it?
