Received and published: 14 October 2020

Two important elements should be included in the paper: 1) Data formats. There are many data models and data formats (e.g. https://www.seadatanet.org/content/download/636/file/SDN2_D85_WP8_Datafile_formats.pdf - but also netCDF in general, oceanSites, etc). The authors should discuss their choices. 2) In 2010 a new standard for the properties of seawater called the thermodynamic equation of seawater 2010 (TEOS-10) was introduced, advocating absolute salinity as a replacement for practical salinity, and conservative temperature as a replacement for potential temperature. (<https://en.wikipedia.org/wiki/Salinity>). The

C1

authors should discuss the common vocabularies generally adopted for the naming conventions (see e.g. <https://vocab.seadatanet.org/search/vocabularies/P01,P02,P03>)

Interactive comment on Earth Syst. Sci. Data Discuss., <https://doi.org/10.5194/essd-2020-229>, 2020.
