## Supplementary Material

Tables S1-S4 contain metadata (dates of the instrument replacements, relocations, changes in the measurement/calculation procedures etc.) for the COI H, I, Z and D geomagnetic field components, respectively.

Table S5 contains a list of European geomagnetic observatories whose data were used as reference series for the COI H, I and Z series.

Figure S1 shows variations of the COI SV series.

Figure 2 shows differences between COV-OBS model estimations calculated with all available stations data and without COI data.

Figures S3-S9 show homogeneity tests statistics for the original and corrected COI H (S3-S5), I (S6-S7) and Z (S8-S9) series.

Figure S10 shows time derivative of the COI H, I and Z series on the month-to-month time scale.

Figure S11 shows  $\Delta H$  series for COI and several reference observatories (SFS, PRA, PER, OSL, PSM and GRW).

Figure S12 allows to compare COI Z variations for the 1990-2006 period with monthly mean COI temperature series.

**Table S1**

Metadata for the H data set: dates of the instrument replacements, relocations, changes in the measurement/calculation procedures etc.

	date	metadata
<i>Cumeada</i>	1866 June	beginning of measurements at <i>Cumeada</i>
	1878 January	installation of the Unifilar of Elliott, precision 1 nT
	1929 May	opening of the electrical tram services
	1932 January	relocation to <i>Alto da Baleia</i>
	1941 December	interruption of measurements
<i>Alto da Baleia</i>	1951 October	Measurements are restated with the Unifilar of Elliott
	1952 January	installation of the QHM (nn. 190-191), precision 1 nT
	1952 November – 1953 January	installation of the QHM (nn. 220-221), precision 1 nT
	1953 September	comparison with 3 instruments (QHM nn. 228, 229, 230) from the Committee on International Comparisons of Magnetic Standards, $\Delta = -5.4$ nT, in average
	1955 July	QHM n. 220 is replaced by QHM n. 307
	1959 August	comparison with instruments from the Committee on International Comparisons of Magnetic Standards, $\Delta = -9.3$ nT, in average
	1968 April	comparison with instruments from the Committee on International Comparisons of Magnetic Standards, $\Delta = -18$ nT, in average
	1976 August	comparison with instruments from the Committee on International Comparisons of Magnetic Standards, $\Delta = +24$ nT, in average
	2006 May	end of measurements

**Table S2**

Metadata for the I data set: dates of the instrument replacements, relocations, changes in the measurement/calculation procedures etc.

	date	metadata
<i>Cumeada</i>	1876 September	Inclinometer of Dover, precision 1'
	1922 November	New needles
	1928 September	New needles
	1929 May	opening of the electrical tram services
	1931 January	Simultaneous measurements at 2 sites
	1932 January	relocation to <i>Alto da Baleia</i>
<i>Alto da Baleia</i>	1935 October	Sartorius earth inductor, precision 0.2-0.5'
	1938 December	end of measurements
	1939 January – 1940 May	The data for this time interval are absent from the COI annual books

**Table S3**

Metadata for the Z data set: dates of the instrument replacements, relocations, changes in the measurement/calculation procedures etc.

---

	date	metadata
	1951 October	beginning of absolute measurements with BMZ n. 69
	1953 January	installation of BMZ (n. 80); comparison of instruments $BMZ_{69} - BMZ_{80} = 25 \text{ nT}$
<i>Alto da Baleia</i>	1963 January	no specific records about Z measurements in the Observatory logbooks before this date
	1963 June	mirror adjustment of the Askania variometer implied a baseline change
	1977 January	installation of BMZ (n. 130)
	2006 May	end of measurements

---

**Table S4.** Metadata for the D data set: dates of the instrument replacements, relocations, changes in the measurement/calculation procedures etc. (adapted from Morozova et al., 2014).

	date	metadata
<i>Cumeada</i>	1875 July (?)	new method to calculate D was applied; new azimuth mark was calculated
	1878 January	Unifilar of Elliot was installed
	1919 January	new procedure to compute the data
	1930 January	tram line installation
	1932 January	relocation to <i>Alto da Baleia</i>
	1948 October – 1951 March	no measurements, data in the annual books were interpolated
<i>Alto da Baleia</i>	1951 October	reinstallation of variographs; new routines for absolute measurements
	1955 July	installation of a new declinometer (Askania) – after comparison with former Elliot no significant differences were found
	1989 May	small instrumental problems and construction in the nearby area
	1990 June-July	small instrumental problems and construction in the nearby area
	1994 May	change of the suspension wire
	2003 March	change of the suspension wire; correction already applied
	2006 January	new instrument was installed in 2006/06; the correction of -6' was applied to the data starting in 2006/01

**Table S5.**

A list of European observatories (EOs) used to obtain the reference series for H, I and Z. Some stations have changes in the instruments and/or were re-located.

	name	code	country	lat.	long.	period	Used as reference series for...
1	Parc Saint-Maur (Paris)	PSM	France	48° 49'	2° 30'	1883-1900	H, I, Z
	Val Joyeux	VLJ		48° 49'	2° 01'	1901-1936	
	Chambon-la-Foret	CLF		48° 01'	2° 16'	1936-1956; 1957-1967; 1968-1982; 1983-2011	
2	Nantes	NTS	France	47° 15'	358° 26'	1923-1958	H, I
3	Perpignan	PER	France	42° 42'	02° 53'	1886-1901; 1907-1910	H, I
4	Toledo	TOL	Spain	39° 53'	355° 27'	1947-1981	H, Z
	San Pablo de los Montes	SPT		39° 33'	355° 39'	1981-2011	
5	Ebro (Tortosa)	EBR	Spain	40° 49'	0° 30'	1909-1937; 1943-1983; 1995-2009	H, I, Z
6	Logrono	LGR	Spain	42° 27'	357° 30'	1957-1976	H, Z
7	San Fernando	SFS	Spain	36° 28'	353° 48'	1880-1963; 1964-1969; 1970-1979	H, I, Z
	San Fernando	SFS2		36° 30'	353° 53'	1991-2005	
8	Oslo	OSL	Norway	59° 55'	10° 43'	1843-1930	H, I
9	Prague	PRA	Czech Republic	50° 05'	14° 25'	1830-1926	H
10	Eskdalemuir	ESK	UK	55° 19'	356° 48'	1908-2011	H, I, Z
11	Greenwich	GRW	UK	51° 29'	0° 0'	1840-1925	H
12	Munich	MNH	Germany	48° 09'	11° 37'	1841-1886; 1899-1926	H, I
13	Potsdam	POT	Germany	52° 23'	13° 4'	1890-2011	H, I, Z
14	Lisbon	LIS	Portugal	38° 43'	350° 51'	1858-1900	H, I
15	L'Aquila	AQU	Italy	42° 23'	13° 19'	1960-2009	H, Z

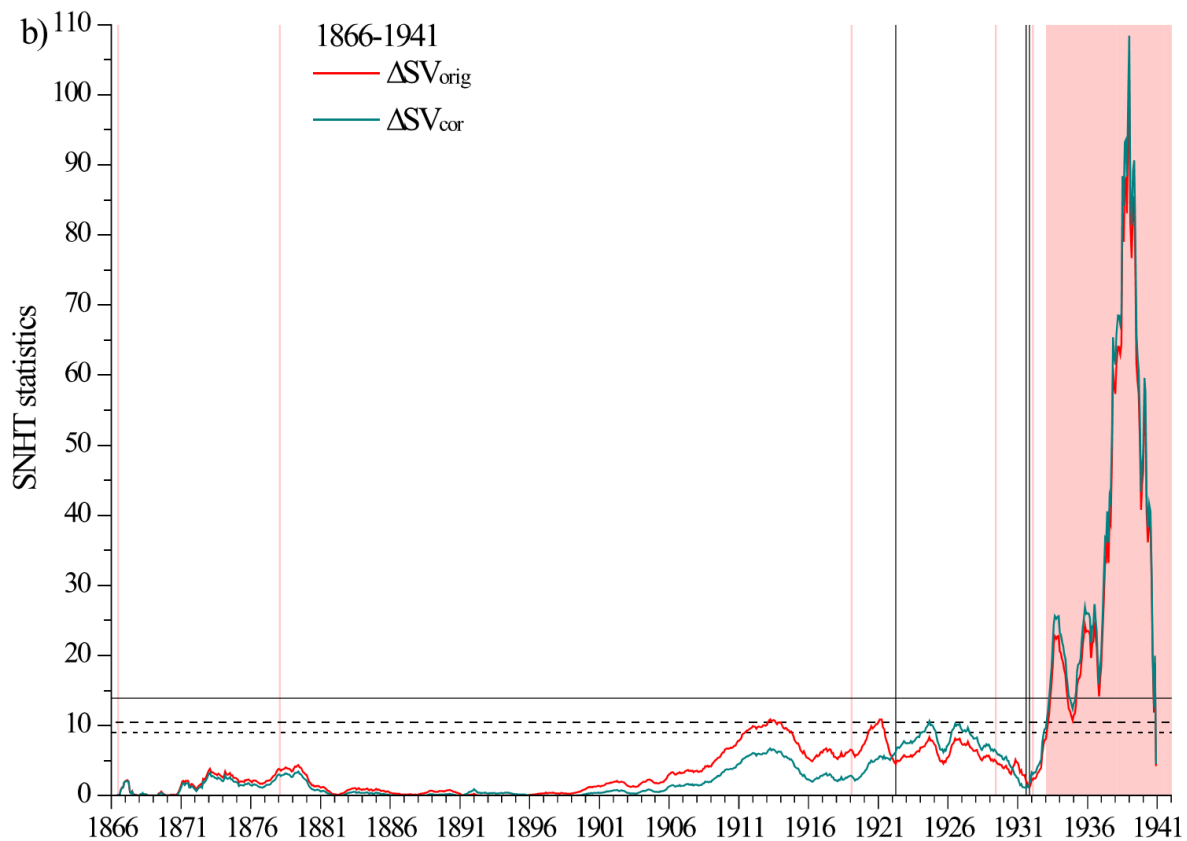

**Figure S1.** Original (red lines) and corrected (blue lines) COI SV H (a and b), I (c) and Z (d) series smoothed by the moving averaging with 12-month long window, SV from the corresponding COV-OBS model (black lines) and SV of the reference series from the EO observatories (green lines). Pink vertical lines/rectangles mark possible dates of HB, black vertical lines mark dates of corrections.

**Figure S2.** Differences between two models: COV-OBS and COV-OBS without COI: H (a), I (b), and Z (c) components.

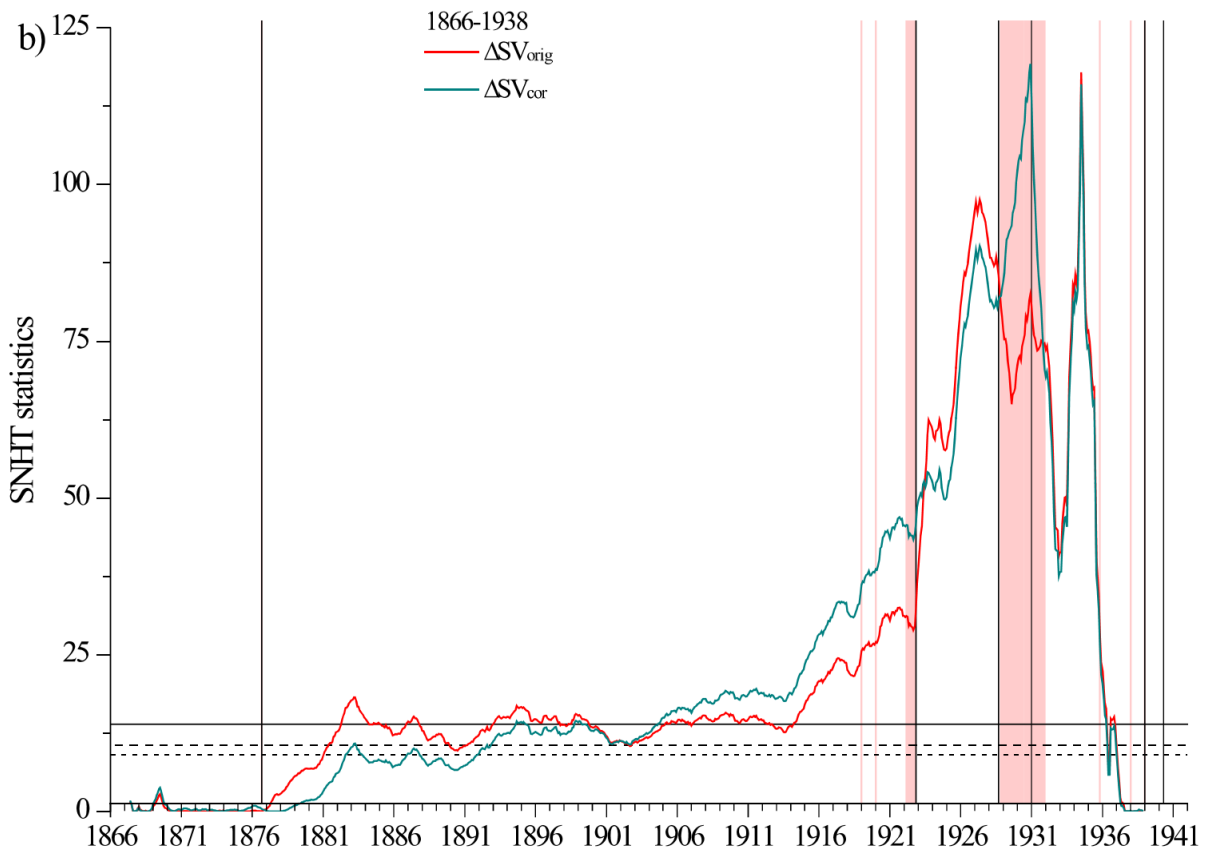

**Figure S3.** Homogeneity tests statistics for COI: H (a) and SV (b) original (red) and corrected (dark cyan) series for the time interval 1866-1941. Pink vertical lines/rectangles mark possible dates of HB, black vertical lines mark dates of corrected HBs. Dotted, dashed and solid horizontal lines mark levels of 90%, 95% and 99% of the statistical significance of HBs.

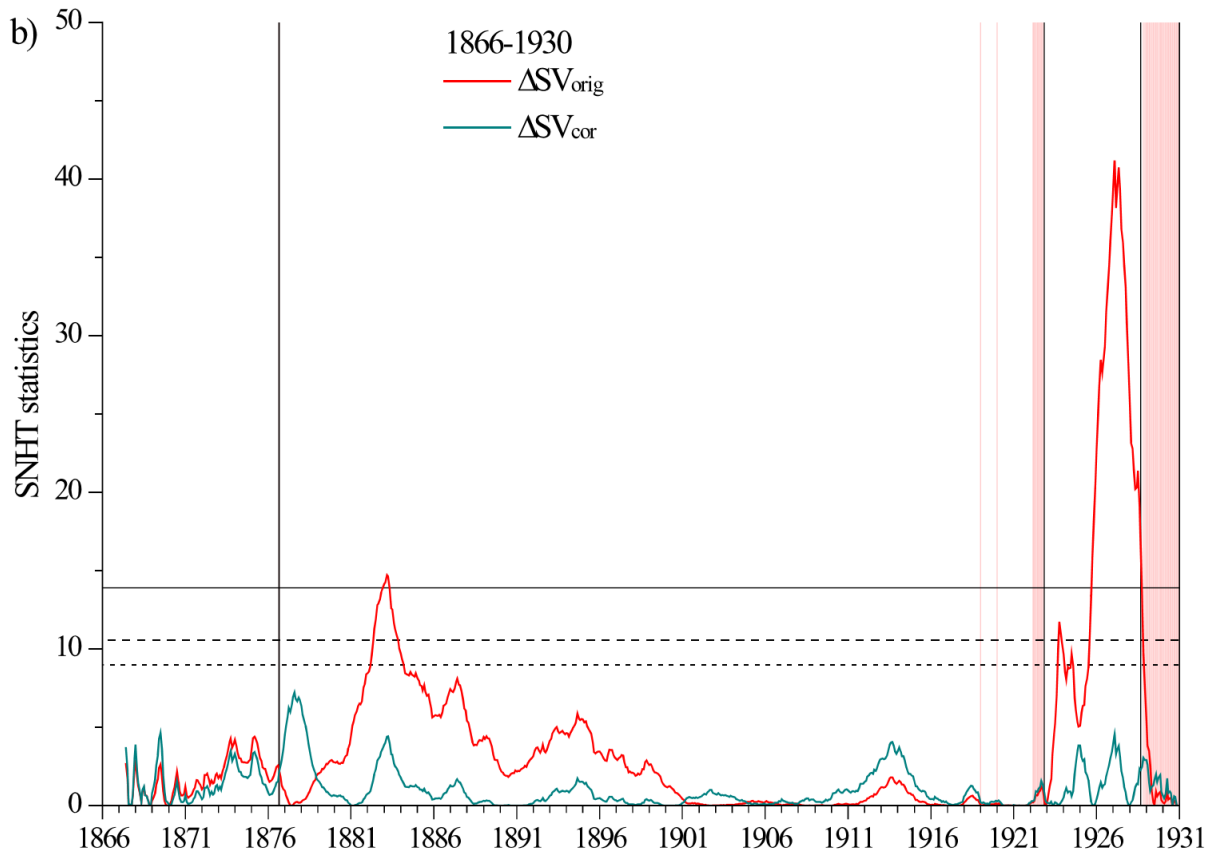

**Figure S4.** Same as Figure S3 but for the time interval 1866-1933.

**Figure S5.** Same as Figure S3 but for the time interval 1951-2005.

**Figure S6.** Same as Figure S3 but for COI I. Time interval: 1866-1938.

**Figure S7.** Same as Figure S6 but for the time interval 1866-1930.

**Figure S8.** Same as Figure S3 but for COI Z. Time interval: 1951-2006.

**Figure S9.** Same as Figure S8 but for the time interval 1951-1990.

**Figure S10.** Time derivative of the original COI: H (a), I (b) and Z (c) series on month-to-month time scale. Pink vertical lines/rectangles mark possible dates of HB.

**Figure S11.**  $\Delta H$  series for the 1860-1940 time interval for seven European stations. (a) COI (thick black), SFS (red), PRA (blue) and PER (yellow). (b) COI (thick black), PSM (green), OSL (cyan) and GRW (magenta).

**Figure S12.**  $\Delta Z$  (black line with dots) for the 1990-2006 period together with monthly mean COI temperature series (red - Tmax, blue - Tmin).
