This contribution describes the data set of building structures in the mid 19th century under which time the study area was under Austro-Hungarian rule. It is a very interesting capture of residential and (agricultural) outbuildings, from a time before accelerated human impact on landscape. The authors use of Second Military Survey maps from 1837-41 and 1861-64 as well as cadastral maps and census data ensures a high quality and gave the opportunity to cross check sources.

The methodology and approach is well explained and issues (such as accuracy for example) were anticipated and addressed in design. Section 3.4 is especially interesting in addressing local differences and discussing reasons behind this.

However, while acknowledging the two categories of buildings (First paragraph 2.2.4) this contribution would benefit from a brief explanation as to what other (non-agricultural) buildings are examples for the black category ("Wirtschaftsgebäude").
