I have not reviewed the data paper in the past, so admittedly can be off on some of the aspects of the review.

Dataset seems useful, well-cleaned, and extremely well documented. Usability has been helped by the detailed description of the data, explanations of their meaning, and the value of data from the unique high-elevation location of Tibetan Alpine Steppe.

In short, if a user wanted to utilize these data for their research or other assessment, they have been provided very clear information on what these data contain, how they were obtained, quality controlled, and re-processed.
