This is a data description manuscript on the surface, subsurface and environmental conditions of two salt pans of Owens Lake and Badwater Basin in central California. A big volume of data, including structured measurements and non-structured images and 3-D models, are given in five datasets that are freely accessible through DOI addresses. Authors did lot of works in field campaign and data processing. This is a good job. The data has potential value on further researching of evaporation, formation and evolution of the salt crust and may contribute to the study on evaporates and mineral resources. In this manuscript authors collected data from the two dry lakes. Could authors make comparisons with other related dataset? Also could author state more (a little bit) about the relate research work? I understand this is a data description
