15 **Abstract.** *Artemisia*, along with Chenopodiaceae is the dominant component growing in the desert and dry
16 grassland of the Northern Hemisphere. *Artemisia* pollen with its high productivity, wide distribution, and easy
17 identification, is usually regarded as an eco-indicator for assessing aridity and distinguishing grassland from
18 desert vegetation in terms of the pollen relative abundance ratio of Chenopodiaceae/*Artemisia* (C/A).
19 Nevertheless, divergent opinions on the degree of aridity evaluated by *Artemisia* pollen have been circulating
20 in the palynological community for a long time. To solve the conclusion, we first selected 36 species from 9
21 clades and 3 outgroups of *Artemisia* based on the phylogenetic framework, which attempts to cover the
22 maximum range of pollen morphological variation. Then, sampling, experiments, photography, and
23 measurements were taken using standard methods. Here, we present pollen datasets containing 4018 original
24 pollen photographs, 7200 statistical pollen morphological traits, information on 30858 source plant
25 occurrences, and corresponding environmental factors. Hierarchical cluster analysis on pollen morphological
26 traits was carried out to subdivide *Artemisia* pollen into three types. When plotting the three pollen types of
27 *Artemisia* onto the global terrestrial ecoregions, different pollen types of *Artemisia* were found to have
28 different habitat ranges. These findings change the traditional concept of *Artemisia* being restricted to arid and
29 semi-arid environments. The data framework that we designed is open and expandable for new pollen data of
30 *Artemisia* worldwide. In the future, linking pollen morphology with habitat via these pollen datasets will
31 create additional knowledge that will increase the resolution of the ecological environment in the geological
32 past. The *Artemisia* pollen datasets are freely available at Zenodo (<https://doi.org/10.5281/zenodo.5842909>;
33 Lu and Jiao, 2022).

34 **1 Introduction**

35 The concept of global change could be regarded as any consistent trend in the environment - past, present, or
36 projected - that affects a substantial part of the globe, following the definition given in the journal *Global*
37 *Change Biology*. Especially importantly, past climates shed light on our future (Tierney et al., 2020). When
38 attempting to reconstruct past global change prior to meteorological records, we need some appropriate
39 biological or abiotic proxies based on long-term, consistently collected data, e.g. leaf wax biomarkers
40 (Bhattacharya et al., 2018), tree-ring data (Moberg et al., 2005), leaf form (Yang et al., 2015), pollen data
41 (Mosbrugger et al., 2005; Guiot and Cramer, 2016; Marsicek et al., 2018), atmospheric carbon dioxide
42 (Zachos et al., 2008; Beerling and Royer, 2011), and isotope records (Zachos et al., 2001; Sánchez-Murillo et
43 al., 2019). Determining a suitable proxy to reconstruct palaeoclimate and palaeoenvironment is a great
44 scientific challenge (Tierney et al., 2020; McClelland et al., 2021).

45 The pollen of *Artemisia* (A), together with that of Chenopodiaceae (C) in arid and semi-arid areas, in the
46 form of the ratio of C/A pollen abundance, was applied to distinguish grassland and desert vegetation types
47 and assess the degree of drought in the geological past (El-Moslimany, 1990; Sun et al., 1994; Davies and Fall,
48 2001; Herzschuh et al., 2004; Xu et al., 2007; Zhao et al., 2009; Zhang et al., 2010; Zhao et al., 2012; Li et al.,
49 2017; Ma et al., 2017; Koutsodendris et al., 2019; Wang et al., 2020), because both Chenopodiaceae and
50 *Artemisia* are dominant elements of desert vegetation (China Vegetation Editorial Committee, 1980; Vrba,
51 1980; Tarasov et al., 1998; Herzschuh et al., 2004; Li et al., 2010; Zhao et al., 2021), and the sum of their
52 pollen relative abundances in the surface soil is usually more than 50% in arid and semi-arid areas (Sun et al.,
53 1994; Lu et al., 2020).

54 Among them, the pollen of *Artemisia*, with its high productivity, wide spatial and temporal distribution,
55 easy identification, and morphological uniformity under the light microscope (LM), is an essential component
56 and useful bio-indicator in pollen-based past vegetation reconstructions and environmental assessments. Some
57 researchers regarded *Artemisia* as an arid indicator (El-Moslimany, 1990; Yi et al., 2003b; Yi et al., 2003a; Liu
58 et al., 2006; Cai et al., 2019; Cui et al., 2019; Chen et al., 2020; Wu et al., 2020; Cao et al., 2021), while others
59 suggested that the correlation between the relative abundance of *Artemisia* pollen and humidity was
60 insignificant (Weng et al., 1993; Sun et al., 1996; Koutsodendris et al., 2019; Lu et al., 2020; Zhao et al.,
61 2021). Therefore, we need to evaluate the habitat heterogeneity of *Artemisia* with different pollen types when
62 possible.

63 In the past, *Artemisia* pollen was regarded as very uniform under LM (Wodehouse, 1926; Sing and Joshi,
64 1969; Ling, 1982; Wang et al., 1995). For instance, following the description and statistics of pollen
65 morphology of 27 species of *Artemisia* in Eurasia under LM, Sing and Joshi (1969) stated that the pollen
66 grains of *Artemisia* are consistent and continuous in morphology. Later, some authors recognized a series of
67 pollen types (Chen, 1987; Jiang et al., 2005; Ghahraman et al., 2007; Shan et al., 2007; Hayat et al., 2009;
68 Hayat et al., 2010; Hussain et al., 2019), based on a detailed survey of the pollen micromorphology of
69 different taxa under the scanning electron microscope (SEM).

70 For example, Chen (1987) described the pollen morphology of 77 *Artemisia* species from China under
71 LM and SEM and divided these pollen grains into six types by using pollen characters, such as the shape and
72 size of the spinules as well as the density of spinules and granules. Type I (sparse spinules with granules
73 among them), type II (dense spinules, no or few granules), type III (sparse spinules, no granules), type IV
74 (dense spinules, well-developed granules), type V (small and sparse spinules, smooth tectum) and type VI
75 (dissimilar spinules with granules among them).

76 Shan et al. (2007) investigated the pollen morphology of 32 *Artemisia* species from the Loess Plateau of
77 China under LM and SEM and divided these pollen grains into five types according to exine sculpture: type I
78 (dense spinules with swollen bases, small granules), type II (dense spinules, swollen bases almost united),
79 type III (dense spinules with swollen bases and smooth tectum), type IV (sparse small spinules and smooth
80 tectum) and type V (sparse spinules, small granules).

81 Jiang et al. (2005) observed the pollen morphology of 57 representative plants in 7 groups of *Artemisia*
82 under LM and SEM. This pollen can be divided into two types based on exine sculpture: type I (spinules
83 multi-ruminated with flared bases, connecting the mostly densely arranged spinules) and type II (densely or
84 loosely arranged spinules without flared bases, interspace glandular or smooth) with subtypes II-1, II-2, II-3,
85 and II-4 based on the distribution of the spinules.

86 Ghahraman et al. (2007) studied the pollen morphology of 26 species of the 33 *Artemisia* species in Iran
87 under LM and SEM. Based on exine ornamentation observed under SEM, two types of pollen grains were
88 recognized: type I, exine surface covered with dense acute spinules, Type II, exine surface with few spinules.

89 Hayat et al. (2009, 2010) carried out a palynological study of 22 *Artemisia* species from Pakistan under
90 LM and SEM. Earlier work demonstrated the phylogenetic associations within *Artemisia* based on a
91 phylogenetic analysis of 9 characters (pollen type, pollen shape, spinule arrangement, exine sculpture, spinule
92 base, the length of polar axis, the length of equatorial axis, exine thickness, and colpus width) of pollen grains

93 of *Artemisia*. In the latter work, eight micromorphological characters were identified and pooled by cluster
94 analysis, leading to the recognition of 5 groups.

95 Hussain et al. (2019) studied the pollen morphology of 15 *Artemisia* species in the Gilgit-Baltistan region
96 of Pakistan utilizing SEM and divided these species into four groups based on cluster analysis of seven
97 micromorphological characters (pollen type, pollen shape, spinule arrangement, exine sculpture, spinule base,
98 polar length, and equatorial width).

99 Almost all of the above-mentioned *Artemisia* pollen classifications were designed to solve taxonomic or
100 phylogenetic problems, and only a few were concerned with linking diverse habitats to the different pollen
101 types in *Artemisia*.

102 Here we attempt to 1) present abundant pollen photographs of 36 species from 9 branches and 3
103 outgroups of the genus (ca. 400 species worldwide, see Ling, 1982; Bremer and Humphries, 1993),
104 constrained by the phylogenetic framework of *Artemisia* (Sanz et al., 2008; Malik et al., 2017); 2) describe
105 and measure the morphological traits of these pollen grains; 3) provide a new classification of pollen types
106 and their distribution worldwide, with a key to pollen types in *Artemisia*; 4) explore the diverse ecological
107 niches of *Artemisia* represented by different pollen types in order to evaluate palaeovegetation and reconstruct
108 palaeoenvironments.

109 **2 Materials and methods**

110 **2.1 Sampling strategy**

111 The 36 pollen samples studied were selected from voucher sheets in the PE herbarium at the Institute of
112 Botany, Chinese Academy of Sciences (Fig. 1, Table B1), covering 9 main clades, i.e., Subg. *Tridentata*, Subg.
113 *Artemisia* (contains Sect. *Artemisia*, Sect. *Abrotanum* I, Sect. *Abrotanum* II and Sect. *Abrotanum* III), Subg.
114 *Pacifica*, Subg. *Seriphidium*, Subg. *Absinthium*, and Subg. *Dracunculus*, constrained by the phylogenetic
115 framework of *Artemisia* (Malik et al., 2017) and 3 outer groups (Sanz et al., 2008), reflecting the maximum
116 diversity or morphological variation under LM and SEM.

126 morphological traits of each species were measured from 20 pollen grains under LM and 5 pollen grains under
127 SEM including pollen grain size, colporate pattern, and exine ornamentation. The mean value (M) and
128 standard deviation (SD) of the pollen grains of each species were measured and calculated in both polar and
129 equatorial views (Appendix A, Table 1).

130 The specimen sampling coordinates of the corresponding taxa were obtained from the Global
131 Biodiversity Information Facility (GBIF, <https://www.gbif.org/>). The corresponding environmental factors
132 including altitude and 19 climate parameters of these coordinates were obtained from WorldClim
133 (<https://www.worldclim.org/>) with a spatial resolution of 30 seconds (~1 km²) in 1970-2000.

134 **2.3 Data processing**

135 OriginPro 2021 software was used for hierarchical cluster analysis on *Artemisia* pollen data. The Euclidean
136 distance was calculated after the normalization of the original data, and the Ward method was used for
137 clustering. Five groups were established, and the center point of each group was calculated according to the
138 sum of distances. OriginPro 2021 software was used to draw group violin diagrams and run an ANOVA to test
139 for an overall difference between the pollen characters of 3 pollen types, followed by post hoc tests (Tukey).
140 OriginPro 2021 software was also used to run correlation coefficients analysed by the Pearson correlation
141 between pollen morphological traits and environmental factors as well as draw group violin diagrams and run
142 a KWANOVA to test for overall differences between the environmental factors of the 3 pollen types. The
143 images of habitats reproduced in the text are from the websites listed in Table B1.

144 The global distribution data of the 36 representative species and 3 pollen types were plotted on the map
145 of terrestrial ecological regions (Olson et al., 2001) using ArcGIS 10.2 software (Figs. 15, 18). Modern
146 altitude and climatic parameters of corresponding coordinates were obtained by Extract MultiValues To Points
147 using ArcGIS 10.2 software in bilinear interpolation.

148 **3 Data description**

149 **3.1 *Artemisia* pollen grains and their source plant habitats**

150 Here we provide detailed data on pollen morphological traits, covering 36 species from 9 main clades of
151 *Artemisia* and 3 outgroups constrained by the phylogenetic framework (Sanz et al., 2008; Malik et al., 2017)
152 under LM and SEM, the habitats of their source plants (Figs. 1-13).

271 3.3 The source plant occurrences

272 The source plant distributions in global terrestrial ecoregions of 36 sampled species are shown in Fig. 15. In
273 *Artemisia*, some species have worldwide distributions, such as *A. vulgaris* (Fig. 15-7), *A. absinthium* (Fig.
274 15-24), and *A. campestris* (Fig. 15-33); a few taxa are limited to East Asia, such as *A. roxburghiana* (Fig.
275 15-10) and *A. blepharolepis* (Fig. 15-26), while others have narrow and isolated distributions in deserts and
276 xeric shrublands of Central Asia, e.g. *A. kurramensis* (Fig. 15-13) and *A. aralensis* (Fig. 15-16). In outgroups
277 of *Artemisia*, *Kaschagaria brachanthemoides* is also confined to deserts and xeric shrublands of Central Asia
278 (Fig. 15-34), while *Ajania pallasiana* lives in forests of East Asia (Fig. 15-35).

279

280 **Figure 15.** The global distribution maps of 36 sampled taxa in terrestrial ecoregions (modified from Olson et
 281 al., 2001).

292 **4 Potential use of the *Artemisia* pollen datasets**

293 **4.1 The pollen classification of *Artemisia***

294 The pollen grains of Anthemideae and Asteraceae under LM could be simply divided into *Artemisia* pollen
295 type (Figs. 2-12, 13a, Appendix A) with indistinct and short spinules and *Anthemis* pollen type such as
296 *Chrysanthemum indicum* and *Ajania pallasiana* (Figs. 13b-c, Appendix A) with distinct and long spines on
297 pollen exine ornamentation (Wodehouse, 1926; Stix, 1960; Chen, 1987; Chen and Zhang, 1991; Martín et al.,
298 2001; Martín et al., 2003; Sanz et al., 2008; Blackmore et al., 2009; Vallès et al., 2011). *Artemisia* pollen
299 grains are difficult to separate from those of other related genera with *Artemisia* pollen type such as
300 *Kaschgaria brachanthemoides* (Figs. 13a1-2, Appendix A), *Elachanthemum*, *Ajaniopsis*, *Filifolium*, and
301 *Neopallasia* (Chen and Zhang, 1991) under LM due to their great similarity in pollen exine ornamentation and
302 colporate patterns (Chen, 1987; Martín et al., 2001; Martín et al., 2003; Vallès et al., 2011). Furthermore, Sing
303 and Joshi (1969) questioned the feasibility of recognizing pollen types under LM in the highly uniform pollen
304 of *Artemisia*. Later, SEM made it possible to subdivide the pollen of *Artemisia* and those of other related
305 genera within the *Artemisia* pollen type using pollen exine ultrastructure characters (Chen, 1987; Chen and
306 Zhang, 1991; Sun and Xu, 1997; Jiang et al., 2005; Ghahraman et al., 2007; Shan et al., 2007; Hayat et al.,
307 2009; Hayat et al., 2010; Hussain et al., 2019).

308 Hierarchical cluster analysis (Fig. 16a) revealed that the pollen morphological traits (P/E, H, D, D/H, Ss,
309 Gs, Gs/Ss, and Ps) of *Artemisia* and its outgroups were divided into Clade A with perforations and without
310 granules (Figs. 13a5-6, b5-6, c5-6) and Clade B with granules and without perforations (Figs. 2-12a5-6, b5-6,
311 c5-6) on the pollen exine under SEM.

312
 313 **Figure 16.** Hierarchical cluster analysis, showing the dendrogram for pollen types from *Artemisia* and
 314 outgroups (a) and the habitat ranges of 36 representative species (b, Tutin et al., 1976; Zhang, 2007; Ling et al.,
 315 2011).

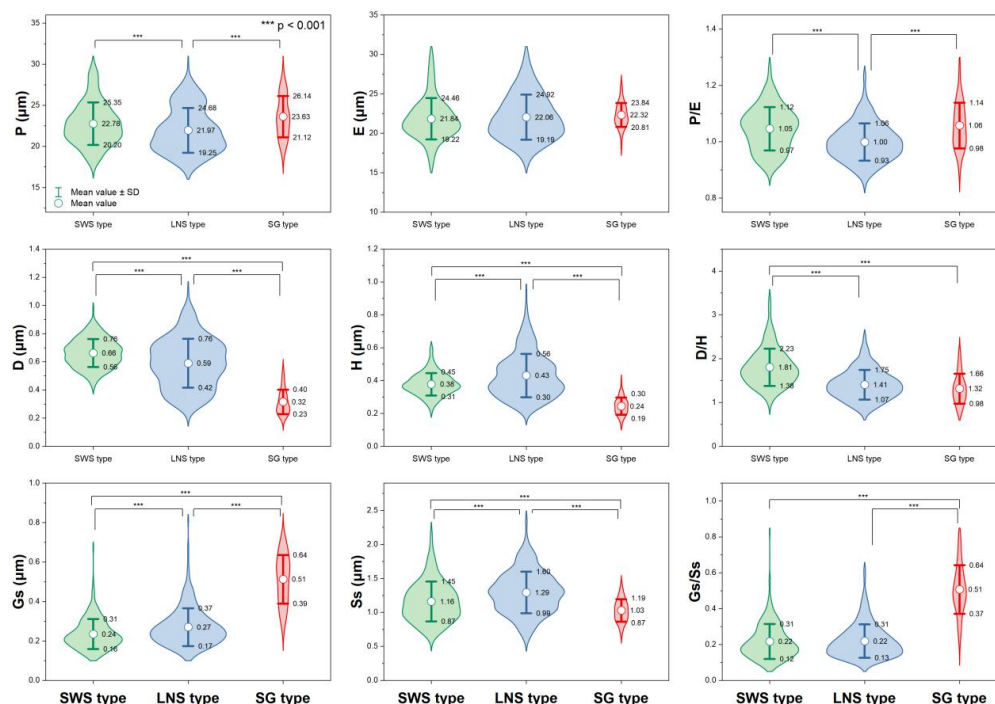

316 In addition, Clade A, as the outgroup of *Artemisia*, includes both *Chrysanthemum indicum* and *Ajania*
 317 *pallasiana* with prominent spines on pollen exine under LM, and *Kaschgaria brachanthemoides* with spinules
 318 on pollen exine (Figs. 13a, 16a). Clade B comprises three pollen types from three branches of *Artemisia* (Fig.
 319 16a), i.e., SG type (short and wide spinule pollen type, Clade B1), LNS type (long and narrow spinule pollen
 320 type, Clade B2-1), and SG type (sparse granule pollen type, Clade B2-2).

321 Nine characteristics of *Artemisia* pollen could partially explain the differences between these 3 pollen
 322 types (Fig. 17). P/E (the length of polar axis/the length of equatorial axis) in LNS types (0.93-1.06) are
 323 significantly different (ANOVA $P < 0.001$) from both SWS (0.97-1.12) and SG (0.98-1.14), so could be used
 324 to identify the LNS type. D/H (diameter of spinule base/spinule height) in the SWS type differ significantly
 325 (ANOVA $P < 0.001$) from both LNS and SG types. The variation range of D/H is 1.38-2.23 in the SWS type,
 326 1.07-1.75 in the LNS type, and 0.98-1.66 in the SG type, indicating that the SWS pollen type is distinguished

327 by short and wide spinules. Gs/Ss (granule spacing/spinule spacing) in the SG type was higher than those of
 328 the SWS and LNS types (ANOVA $P < 0.001$), which distinguished the SG type from the other two types.
 329 Moreover, the SG type is characterized by sparse granules with the variation range of Gs/Ss spanning
 330 0.37-0.64, while the SWS and LNS types show much denser granules whose Gs/Ss are mainly below 0.35.

331 Within the new *Artemisia* pollen classification (Fig. 16a, Key), the SWS type represents a type of pollen
 332 with short and wide spinules ($D/H > 1.81$) and dense granules (Figs. 16a, 17). The LNS type is a spheroidal or
 333 prolate pollen type ($P/E < 0.97$) with long and narrow spinules ($D/H < 1.38$) and dense granules (Figs. 16a,
 334 17). The SG type is characterized by sparse granules ($Gs/Ss > 0.37$) and small, long, and narrow spinules
 335 (Figs. 16a, 17).

336 **Figure 17.** Violin diagram of three pollen types from *Artemisia*, showing the variations ($M \pm SD$) in nine
 337 pollen characters. Asterisks indicate statistically significant differences ($p < 0.001$).
 338 (P: length of polar axis; E: length of equatorial axis; D: diameter of spinule base; H: spinule height; Gs:
 339 granule spacing; Ss: spinule spacing; Ps: perforation spacing)
 340

341 **Key to 3 pollen types of *Artemisia* and 3 outgroups**

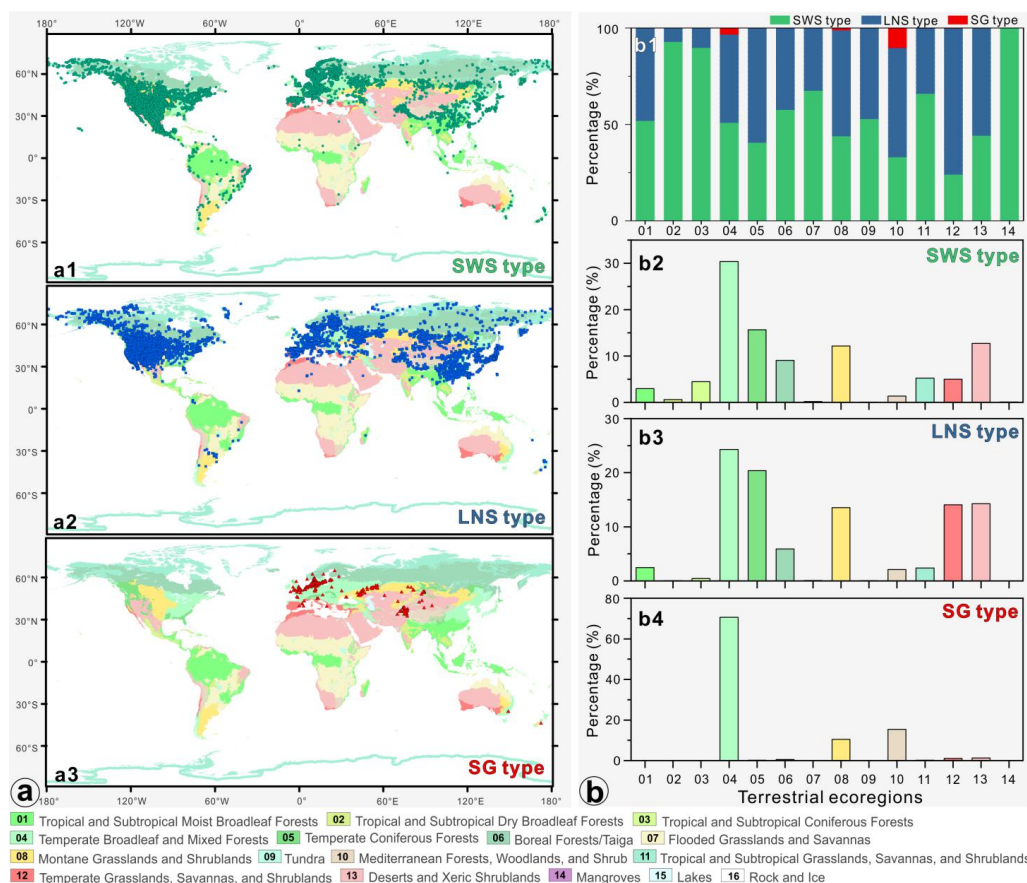

- 342 1. Pollen exine with perforations and without granules under SEM 2
 343 1. Pollen exine with granules and without perforations under SEM 3
 344 2. Distinct and long spines on pollen exine, with $H > 3 \mu m$*C. indicum* & *Ajania pallasiana*

- 345 2. Indistinct and short spinules on pollen exine, with $H < 1\mu\text{m}$*K. brachanthemoides*
- 346 3. Pollen exine with sparse granules and $G_s/S_s \geq 0.37$ under SEM SG type
- 347 3. Pollen exine with dense granules and $G_s/S_s \leq 0.31$ under SEM..... 4
- 348 4. $P/E < 0.97$ and pollen exine with $D/H < 1.38$ under SEM..... LNS type
- 349 4. $P/E \geq 0.97$ and pollen exine with $D/H \geq 1.38$ under SEM..... SWS type

350 **4.2 The ecological implications of *Artemisia* pollen types**

351 Plotting the distribution data of 33 species from 9 main branches of *Artemisia* constrained by the phylogenetic
 352 framework (Fig. 1) onto the global terrestrial ecoregions (Fig. 18a), we noticed that the genus is widely
 353 distributed from forest to grassland, desert, and saline habitats (Figs. 15, 16a, 18a). Furthermore, different
 354 species of *Artemisia* with SWS pollen type (Fig. 18a1) and LNS type (Fig. 18a2) have a rather wide
 355 distribution with severely overlapping ranges while those with SG type (Fig. 18a3) have narrow and isolated
 356 distributions.

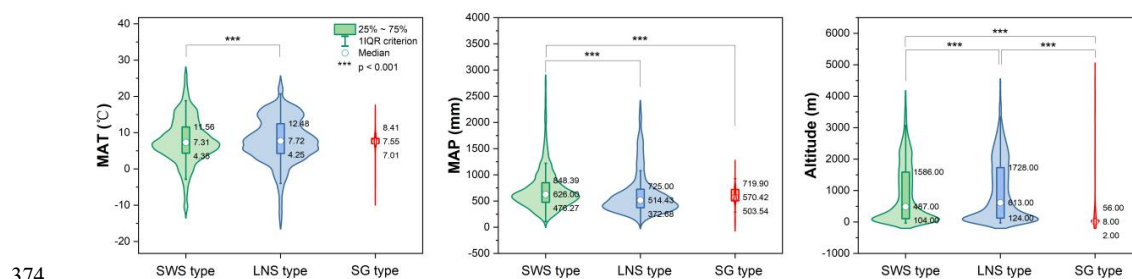

357

358 **Figure 18.** The global distribution pattern of 3 *Artemisia* pollen types in terrestrial ecoregions (modified from
 359 Olson et al., 2001). a. The maps display the global distribution of SWS type (a1), LNS type (a2), and SG type
 360 (a3). b. The histograms show the proportion of 3 pollen types in 14 terrestrial ecoregions. The proportion of
 361 the three pollen types in each terrestrial ecoregion (b1) as well as the proportions of SWS type (b2), LNS type
 362 (b3), and SG type (b4) in 14 ecoregions.

363 The ecological implications of *Artemisia* pollen types mentioned above fall into four categories. (i)
 364 *Artemisia* with the SG pollen type all belong to the subg. *Seriphidium*, which generally grows in dry habitats
 365 ranging from grassland desert to desert and coastal saline-alkaline environments (Figs. 16b, 18b1, 18b4, 19),
 366 with their distribution largely limited to Eurasia and having lowest mean annual temperature (MAT) and mean
 367 annual precipitation (MAP). (ii) The habitats of *Artemisia* with LNS pollen type have a global distribution and
 368 occur in forest, grassland and desert, and even coastal areas (Figs. 16b, 18b1, 18b3, 19), with the highest MAT.
 369 Hence, the LNS pollen type is a generalist. (iii) *Artemisia* with SWS pollen type include Sect. *Artemisia* and
 370 its habitats range from forest to desert, although most of the taxa are confined to humid environments from
 371 forest to grassland with a global distribution (Figs. 16b, 18b1, 18b2, 19), and the highest MAP. (iv) If the SWS
 372 pollen type and the SG pollen type appear together, the range of vegetation types could be reduced to
 373 grassland desert and desert through niche coexistence (Fig. 16b).

374 **Figure 19.** Violin diagram of three pollen types from *Artemisia*, showing the variations (25%-75%) in MAT,
 375 MAP, and altitude. Asterisks indicate statistically significant differences ($p < 0.001$).

377 In addition, we noticed that *Kaschgaria brachanthemoides* as an outgroup of *Artemisia* lives in dry
 378 mountain valleys or dry riverbeds of Northwest China (Toksun) and Kazakhstan, with highly characteristic
 379 pollen (Fig. 12a), narrow habitats (Fig. 16b), and regional distribution (Fig. 15-34) and has the potential to
 380 indicate some specific habitats.

381 **5 Data availability**

382 Pollen datasets (Table 2) including pollen photographs under LM and SEM, statistical data of pollen
 383 morphological traits, and their source plant distribution for each species are available at Zenodo
 384 (<https://doi.org/10.5281/zenodo.5842909>; Lu and Jiao, 2022).

385 **Table 2.** *Artemisia* pollen datasets in this study.

The corresponding environmental factors of these coordinates were obtained from WorldClim (https://www.worldclim.org/) with a spatial resolution of 30 seconds between 1970-2000.	Lu and Jiao, 2022)

386 6 Summary

387 To cover the maximum range of *Artemisia* pollen morphological variation, we provide a pollen dataset of 36
 388 species from 9 clades and 3 outgroups of *Artemisia* constrained by the phylogenetic framework, containing
 389 high-quality pollen photographs under LM and SEM, statistical data of pollen morphological traits, together
 390 with their source plant distribution, and corresponding environmental factors. Here, we attempt to decipher the

391 underlying causes of the long-standing disagreement in the palynological community on the correlation
392 between *Artemisia* pollen and aridity by recognizing the different ecological implications of *Artemisia* pollen
393 types.

394 This dataset should work well for identifying and classifying *Artemisia* pollen from Neogene sediments.
395 Based on the evidence that *Artemisia* pollen grains are consistent in morphology under LM, but different types
396 can be recognized under SEM, we could apply the single-grain technique for picking out pollen grains from
397 the Neogene sediments and photographing the same grains under LM and SEM (Ferguson et al., 2007;
398 Grímsson et al., 2011; Grímsson et al., 2012; Halbritter et al., 2018). Next, we could identify those *Artemisia*
399 pollen grains by comparison with the rich photographs from this dataset, and further recognize different
400 *Artemisia* pollen types, which provide a link to the different habitat ranges.

401 However, the application of this dataset probably may not function well for the Palaeogene, as 1)
402 *Artemisia* might have originated in the Palaeocene, but there is no evidence for a specific origin location or
403 time intervals (e.g. Ling 1982; Wang 2004; Miao 2011); 2) both the lack of macrofossils of *Artemisia* and the
404 strong pollen similarity between *Artemisia* and its closely related taxa under LM might lead to confusion and
405 more uncertainty in tracing the the origin of *Artemisia*. On the other hand, the present dataset provides a
406 potential morphological tool to distinguish *Artemisia* pollen grains from those of its related taxa at the SEM
407 level in order to solve the confusion in the Palaeogene.

408 Finally and most importantly, the *Artemisia* pollen dataset as designed is open and expandable for new
409 pollen data from *Artemisia* worldwide in order to better serve the global environment assessment and refined
410 reconstruction of vegetation in the geological past.

411 **Appendix A**

412 **Text A1**

413 Pollen morphology descriptions of 36 representative species from 9 clades of *Artemisia* and 3 outgroups.

414 **1. *Artemisia cana* (Table 1, Figs. 2a, 14)**

415 Pollen grains spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar view.
416 Apertures tricolporate. The exine near the colpi gradually thinned. Polar length (P) = $23.46 \pm 1.76 \mu\text{m}$ (M \pm
417 SD), equatorial width (E) = $24.50 \pm 2.13 \mu\text{m}$ (M \pm SD), P/E = 0.96 ± 0.04 (M \pm SD). The exine ornamentation
418 is psilate (LM), spinulate (SEM). Under SEM, diameter of spinule base (D) = $0.58 \pm 0.13 \mu\text{m}$ (M \pm SD),
419 spinule height (H) = $0.46 \pm 0.08 \mu\text{m}$ (M \pm SD), D/H = 1.28 ± 0.38 (M \pm SD), granule spacing (Gs) = $0.33 \pm$
420 $0.08 \mu\text{m}$ (M \pm SD), spinule spacing (Ss) = $1.60 \pm 0.22 \mu\text{m}$ (M \pm SD), Gs/Ss = 0.21 ± 0.06 (M \pm SD).

421 Habitat: grasslands, gravel soils, mountain meadows, stream banks; Wet mountain meadows, stream banks,
422 rocky areas with late-lying snows.

423 **2. *Artemisia tridentata* (Table 1, Figs. 2b, 14)**

424 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
425 Apertures tricolporate. The exine near the colpi gradually thinned. P = $21.36 \pm 1.54 \mu\text{m}$, E = $20.69 \pm 1.85 \mu\text{m}$,
426 P/E = 1.04 ± 0.07 . The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, D = 0.76 ± 0.08
427 μm , H = $0.60 \pm 0.08 \mu\text{m}$, D/H = 1.30 ± 0.23 , Gs = $0.24 \pm 0.06 \mu\text{m}$, Ss = $1.12 \pm 0.22 \mu\text{m}$, Gs/Ss = 0.22 ± 0.08 .

428 Habitat: mountains, grasslands, and meadows of western North America. Arid and semi-arid, desert, or
429 semi-desert areas of the growing shrub or semi-shrub environment.

430 **3. *Artemisia californica* (Table 1, Figs. 2c, 14)**

431 Pollen grains prolate or spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar
432 view. Apertures tricolporate. The exine near the colpi gradually thinned. P = $18.94 \pm 1.30 \mu\text{m}$, E = $19.13 \pm$
433 $1.43 \mu\text{m}$, P/E = 0.99 ± 0.08 . The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, D = 0.75
434 $\pm 0.11 \mu\text{m}$, H = $0.71 \pm 0.10 \mu\text{m}$, D/H = 1.08 ± 0.20 , Gs = $0.24 \pm 0.05 \mu\text{m}$, Ss = $1.45 \pm 0.23 \mu\text{m}$, Gs/Ss = $0.17 \pm$
435 0.05 .

436 Habitat: coastal scrub, dry foothills.

437 **4. *Artemisia indica* (Table 1, Figs. 3a, 14)**

438 Pollen grains spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar view.
439 Apertures tricolporate. The exine near the colpi gradually thinned. P = $23.47 \pm 1.39 \mu\text{m}$, E = $23.81 \pm 0.86 \mu\text{m}$,
440 P/E = 0.99 ± 0.06 . The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, D = 0.76 ± 0.10
441 μm , H = $0.39 \pm 0.06 \mu\text{m}$, D/H = 2.04 ± 0.53 , Gs = $0.28 \pm 0.07 \mu\text{m}$, Ss = $1.21 \pm 0.24 \mu\text{m}$, Gs/Ss = 0.24 ± 0.07 .

442 Habitat: roadsides, forest margins, slopes, shrublands; low elevations to 2000 m.

443 **5. *Artemisia argyi* (Table 1, Figs. 3b, 14)**

444 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
445 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 21.80 \pm 1.00 \mu\text{m}$, $E = 21.67 \pm 1.27 \mu\text{m}$,
446 $P/E = 1.01 \pm 0.08$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.64 \pm 0.07$
447 μm , $H = 0.38 \pm 0.04 \mu\text{m}$, $D/H = 1.71 \pm 0.23$, $G_s = 0.22 \pm 0.06 \mu\text{m}$, $S_s = 0.90 \pm 0.17 \mu\text{m}$, $G_s/S_s = 0.26 \pm 0.09$.

448 Habitat: waste places, roadsides, slopes, hills, steppes, forest steppes; low elevations to 1500 m.

449 **6. *Artemisia mongolica* (Table 1, Figs. 3c, 14)**

450 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
451 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 21.05 \pm 0.82 \mu\text{m}$, $E = 20.42 \pm 1.01 \mu\text{m}$,
452 $P/E = 1.03 \pm 0.05$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.62 \pm 0.08$
453 μm , $H = 0.41 \pm 0.05 \mu\text{m}$, $D/H = 1.54 \pm 0.25$, $G_s = 0.19 \pm 0.06 \mu\text{m}$, $S_s = 0.91 \pm 0.14 \mu\text{m}$, $G_s/S_s = 0.22 \pm 0.08$.

454 Habitat: slopes, shrublands, riverbanks, lakeshores, roadsides, steppes, forest steppes, dry valleys; low
455 elevations to 2000 m.

456 **7. *Artemisia vulgaris* (Table 1, Figs. 4a, 14)**

457 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
458 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 19.72 \pm 1.25 \mu\text{m}$, $E = 19.29 \pm 1.82 \mu\text{m}$,
459 $P/E = 1.03 \pm 0.08$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.69 \pm 0.07$
460 μm , $H = 0.34 \pm 0.07 \mu\text{m}$, $D/H = 2.13 \pm 0.52$, $G_s = 0.29 \pm 0.07 \mu\text{m}$, $S_s = 1.55 \pm 0.32 \mu\text{m}$, $G_s/S_s = 0.20 \pm 0.07$.

461 Habitat: roadsides, slopes, canyons, forest margins, forest steppes, subalpine steppes; 1500-3800 m.

462 **8. *Artemisia selengensis* (Table 1, Figs. 4b, 14)**

463 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
464 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 20.67 \pm 1.57 \mu\text{m}$, $E = 19.68 \pm 1.94 \mu\text{m}$,
465 $P/E = 1.06 \pm 0.09$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.67 \pm 0.08$
466 μm , $H = 0.38 \pm 0.05 \mu\text{m}$, $D/H = 1.76 \pm 0.27$, $G_s = 0.22 \pm 0.06 \mu\text{m}$, $S_s = 1.05 \pm 0.15 \mu\text{m}$, $G_s/S_s = 0.22 \pm 0.07$.

467 Habitat: riverbanks, lakeshores, humid areas, meadows, slopes, roadsides.

468 **9. *Artemisia ludoviciana* (Table 1, Figs. 4c, 14)**

469 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
470 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 21.65 \pm 1.02 \mu\text{m}$, $E = 20.82 \pm 1.10 \mu\text{m}$,
471 $P/E = 1.04 \pm 0.08$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.70 \pm 0.08$
472 μm , $H = 0.37 \pm 0.04 \mu\text{m}$, $D/H = 1.94 \pm 0.31$, $G_s = 0.20 \pm 0.05 \mu\text{m}$, $S_s = 1.23 \pm 0.13 \mu\text{m}$, $G_s/S_s = 0.16 \pm 0.04$.

473 Habitat: disturbed roadsides, open meadows, rocky slopes.

474 **10. *Artemisia roxburghiana* (Table 1, Figs. 5a, 14)**

475 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
476 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 23.88 \pm 2.04 \mu\text{m}$, $E = 23.69 \pm 2.00 \mu\text{m}$,
477 $P/E = 1.01 \pm 0.06$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.76 \pm 0.07$
478 μm , $H = 0.39 \pm 0.06 \mu\text{m}$, $D/H = 1.96 \pm 0.37$, $G_s = 0.28 \pm 0.11 \mu\text{m}$, $S_s = 0.79 \pm 0.11 \mu\text{m}$, $G_s/S_s = 0.36 \pm 0.14$.

479 Habitat: roadsides, slopes, dry canyons, grasslands, waste areas, terraces; 700-3900 m.

480 **11. *Artemisia rutifolia* (Table 1, Figs. 5b, 14)**

481 Pollen grains spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar view.
482 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 22.22 \pm 1.10 \mu\text{m}$, $E = 22.70 \pm 1.37 \mu\text{m}$,
483 $P/E = 0.98 \pm 0.05$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.31 \pm 0.04$
484 μm , $H = 0.26 \pm 0.04 \mu\text{m}$, $D/H = 1.20 \pm 0.18$, $G_s = 0.21 \pm 0.05 \mu\text{m}$, $S_s = 1.27 \pm 0.19 \mu\text{m}$, $G_s/S_s = 0.17 \pm 0.04$.

485 Habitat: hills, dry river valleys, basins, steppes, semideserts, stony desert; 1300-5000 m.

486 **12. *Artemisia chinensis* (Table 1, Figs. 5c, 14)**

487 Pollen grains spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar view.
488 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 21.53 \pm 1.95 \mu\text{m}$, $E = 22.75 \pm 2.00 \mu\text{m}$,
489 $P/E = 0.95 \pm 0.05$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.70 \pm 0.05$
490 μm , $H = 0.55 \pm 0.07 \mu\text{m}$, $D/H = 1.29 \pm 0.19$, $G_s = 0.27 \pm 0.07 \mu\text{m}$, $S_s = 0.91 \pm 0.17 \mu\text{m}$, $G_s/S_s = 0.31 \pm 0.09$.

491 Habitat: littoral plants found on raised coral outcrops.

492 **13. *Artemisia kurramensis* (Table 1, Figs. 6a, 14)**

493 Pollen grains spheroidal. Almost circular in equatorial view and trilobate circular in polar view. Apertures
494 tricolporate. The exine near the colpi gradually thinned. $P = 19.71 \pm 1.28 \mu\text{m}$, $E = 19.35 \pm 1.02 \mu\text{m}$, $P/E = 1.02$
495 ± 0.05 . The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.38 \pm 0.04 \mu\text{m}$, $H = 0.27$
496 $\pm 0.03 \mu\text{m}$, $D/H = 1.41 \pm 0.21$, $G_s = 0.23 \pm 0.07 \mu\text{m}$, $S_s = 1.25 \pm 0.21 \mu\text{m}$, $G_s/S_s = 0.19 \pm 0.06$.

497 Habitat: foothills, mountain slopes, dry graveyards, field borders with sparse vegetation on gravelly, fine to
498 coarse sandy-clay soils.

499 **14. *Artemisia compactum* (Table 1, Figs. 6b, 14)**

500 Pollen grains spheroidal. Almost circular in equatorial view and trilobate circular in polar view. Apertures
501 tricolporate. The exine near the colpi gradually thinned. $P = 22.33 \pm 1.81 \mu\text{m}$, $E = 21.97 \pm 1.23 \mu\text{m}$, $P/E = 1.02$
502 ± 0.06 . The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.41 \pm 0.07 \mu\text{m}$, $H = 0.28$
503 $\pm 0.03 \mu\text{m}$, $D/H = 1.50 \pm 0.33$, $G_s = 0.51 \pm 0.12 \mu\text{m}$, $S_s = 0.92 \pm 0.12 \mu\text{m}$, $G_s/S_s = 0.56 \pm 0.12$.

504 Habitat: rocky slopes, semi-deserts, from low elevations to sub-alpine areas.

505 **15. *Artemisia maritima* (Table 1, Figs. 6c, 14)**

506 Pollen grains prolate. Almost circular in equatorial view and trilobate circular in polar view. Apertures
507 tricolporate. The exine near the colpi gradually thinned. $P = 26.24 \pm 1.61 \mu\text{m}$, $E = 23.09 \pm 1.43 \mu\text{m}$, $P/E = 1.14$
508 ± 0.06 . The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.28 \pm 0.04 \mu\text{m}$, $H = 0.23$
509 $\pm 0.06 \mu\text{m}$, $D/H = 1.30 \pm 0.34$, $G_s = 0.53 \pm 0.12 \mu\text{m}$, $S_s = 1.08 \pm 0.12 \mu\text{m}$, $G_s/S_s = 0.50 \pm 0.13$.

510 Habitat: saltmarsh, dry and calcareous hillsides, seashores, and dry saline or alkaline soils.

511 **16. *Artemisia aralensis* (Table 1, Figs. 7a, 14)**

512 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
513 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 22.32 \pm 1.72 \mu\text{m}$, $E = 21.91 \pm 1.63 \mu\text{m}$,
514 $P/E = 1.02 \pm 0.06$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.25 \pm 0.04$
515 μm , $H = 0.22 \pm 0.04 \mu\text{m}$, $D/H = 1.16 \pm 0.28$, $G_s = 0.50 \pm 0.13 \mu\text{m}$, $S_s = 1.09 \pm 0.18 \mu\text{m}$, $G_s/S_s = 0.46 \pm 0.14$.

516 Habitat: clayey, sandy loam, solonchic soils.

517 **17. *Artemisia annua* (Table 1, Figs. 7b, 14)**

518 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
519 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 19.71 \pm 0.84 \mu\text{m}$, $E = 19.45 \pm 1.32 \mu\text{m}$,
520 $P/E = 1.02 \pm 0.07$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.45 \pm 0.06$
521 μm , $H = 0.39 \pm 0.05 \mu\text{m}$, $D/H = 1.18 \pm 0.25$, $G_s = 0.27 \pm 0.08 \mu\text{m}$, $S_s = 1.29 \pm 0.16 \mu\text{m}$, $G_s/S_s = 0.21 \pm 0.08$.

522 Habitat: hills, waysides, wastelands, outer forest margins, steppes, forest steppes, dry flood lands, terraces,
523 semidesert steppes, rocky slopes, roadsides, saline soils; 2000-3700 m.

524 **18. *Artemisia freyniana* (Table 1, Figs. 7c, 14)**

525 Pollen grains prolate. Almost circular in equatorial view and trilobate circular in polar view. Apertures
526 tricolporate. The exine near the colpi gradually thinned. $P = 23.39 \pm 1.21 \mu\text{m}$, $E = 21.30 \pm 1.07 \mu\text{m}$, $P/E = 1.10$
527 ± 0.04 . The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.56 \pm 0.05 \mu\text{m}$, $H = 0.40$
528 $\pm 0.06 \mu\text{m}$, $D/H = 1.40 \pm 0.15$, $G_s = 0.20 \pm 0.05 \mu\text{m}$, $S_s = 1.15 \pm 0.15 \mu\text{m}$, $G_s/S_s = 0.18 \pm 0.05$.

529 Habitat: steppes, slopes, dry river valleys, riverbanks, outer forest margins.

530 **19. *Artemisia stechmanniana* (Table 1, Figs. 8a, 14)**

531 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
532 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 26.31 \pm 1.48 \mu\text{m}$, $E = 25.16 \pm 1.22 \mu\text{m}$,
533 $P/E = 1.05 \pm 0.07$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.37 \pm 0.05$
534 μm , $H = 0.35 \pm 0.05 \mu\text{m}$, $D/H = 1.07 \pm 0.25$, $G_s = 0.19 \pm 0.04 \mu\text{m}$, $S_s = 1.40 \pm 0.24 \mu\text{m}$, $G_s/S_s = 0.14 \pm 0.04$.

535 Habitat: hillsides, roadsides, shrubland, and forest-steppe areas, and often becoming the dominant species or
536 main associated species of plant communities in some areas of mountainous sunny slopes.

537 **20. *Artemisia pontica* (Table 1, Figs. 8b, 14)**

538 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
539 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 20.64 \pm 1.54 \mu\text{m}$, $E = 19.62 \pm 1.59 \mu\text{m}$,
540 $P/E = 1.05 \pm 0.07$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.60 \pm 0.11$
541 μm , $H = 0.37 \pm 0.06 \mu\text{m}$, $D/H = 1.63 \pm 0.37$, $G_s = 0.17 \pm 0.04 \mu\text{m}$, $S_s = 1.32 \pm 0.27 \mu\text{m}$, $G_s/S_s = 0.13 \pm 0.04$.

542 Habitat: rocky slopes, dry valleys, steppes, hills; low to middle elevations.

543 **21. *Artemisia frigida* (Table 1, Figs. 8c, 14)**

544 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
545 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 25.11 \pm 1.75 \mu\text{m}$, $E = 24.90 \pm 1.48 \mu\text{m}$,
546 $P/E = 1.01 \pm 0.07$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.46 \pm 0.08$
547 μm , $H = 0.32 \pm 0.04 \mu\text{m}$, $D/H = 1.44 \pm 0.26$, $G_s = 0.31 \pm 0.08 \mu\text{m}$, $S_s = 1.30 \pm 0.18 \mu\text{m}$, $G_s/S_s = 0.24 \pm 0.06$.

548 Habitat: steppes, sub-alpine meadows, dry hillsides, stable dunes, dry waste areas; 1000-4000 m.

549 **22. *Artemisia rupestris* (Table 1, Figs. 9a, 14)**

550 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
551 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 24.45 \pm 1.41 \mu\text{m}$, $E = 22.92 \pm 1.40 \mu\text{m}$,
552 $P/E = 1.07 \pm 0.08$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.55 \pm 0.05$
553 μm , $H = 0.33 \pm 0.04 \mu\text{m}$, $D/H = 1.68 \pm 0.28$, $G_s = 0.25 \pm 0.07 \mu\text{m}$, $S_s = 0.91 \pm 0.11 \mu\text{m}$, $G_s/S_s = 0.28 \pm 0.09$.

554 Habitat: dry hills, desert or semidesert steppes, grassy marshlands, dry river valleys, riverbeds, scrub, forest
555 margins.

556 **23. *Artemisia sericea* (Table 1, Figs. 9b, 14)**

557 Pollen grains spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar view.
558 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 26.31 \pm 1.31 \mu\text{m}$, $E = 27.90 \pm 1.67 \mu\text{m}$,
559 $P/E = 0.94 \pm 0.03$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.89 \pm 0.09$
560 μm , $H = 0.54 \pm 0.10 \mu\text{m}$, $D/H = 1.71 \pm 0.36$, $G_s = 0.28 \pm 0.07 \mu\text{m}$, $S_s = 1.74 \pm 0.31 \mu\text{m}$, $G_s/S_s = 0.16 \pm 0.05$.

561 Habitat: Forest margins, hills, steppes, canyons, waste areas.

562 **24. *Artemisia absinthium* (Table 1, Figs. 9c, 14)**

563 Pollen grains prolate. Almost circular in equatorial view and trilobate circular in polar view. Apertures
564 tricolporate. The exine near the colpi gradually thinned. $P = 22.79 \pm 1.22 \mu\text{m}$, $E = 20.84 \pm 1.11 \mu\text{m}$, $P/E = 1.09$

565 ± 0.05 . The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.59 \pm 0.05 \mu\text{m}$, $H = 0.40$
566 $\pm 0.06 \mu\text{m}$, $D/H = 1.52 \pm 0.25$, $G_s = 0.18 \pm 0.04 \mu\text{m}$, $S_s = 1.11 \pm 0.15 \mu\text{m}$, $G_s/S_s = 0.16 \pm 0.04$.

567 Habitat: hillsides, steppes, scrub, forest margins, often in locally moist situations; 1100-1500 m.

568 **25. *Artemisia abrotanum* (Table 1, Figs. 10a, 14)**

569 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
570 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 24.47 \pm 1.56 \mu\text{m}$, $E = 23.73 \pm 1.65 \mu\text{m}$,
571 $P/E = 1.03 \pm 0.07$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.72 \pm 0.10$
572 μm , $H = 0.51 \pm 0.05 \mu\text{m}$, $D/H = 1.44 \pm 0.25$, $G_s = 0.22 \pm 0.04 \mu\text{m}$, $S_s = 1.41 \pm 0.19 \mu\text{m}$, $G_s/S_s = 0.16 \pm 0.04$.

573 Habitat: the wasteland of western, southern, central, and southern Europe.

574 **26. *Artemisia blepharolepis* (Table 1, Figs. 10b, 14)**

575 Pollen grains spheroidal. Almost circular in equatorial view and trilobate circular in polar view. Apertures
576 tricolporate. The exine near the colpi gradually thinned. $P = 18.96 \pm 0.98 \mu\text{m}$, $E = 19.26 \pm 0.99 \mu\text{m}$, $P/E = 0.99$
577 ± 0.05 . The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.69 \pm 0.09 \mu\text{m}$, $H = 0.44$
578 $\pm 0.07 \mu\text{m}$, $D/H = 1.64 \pm 0.44$, $G_s = 0.37 \pm 0.18 \mu\text{m}$, $S_s = 1.68 \pm 0.20 \mu\text{m}$, $G_s/S_s = 0.23 \pm 0.14$.

579 Habitat: low-altitude areas of dry slopes, grasslands, steppes, waste areas, roadsides, dunes near riverbanks.

580 **27. *Artemisia norvegica* (Table 1, Figs. 10c, 14)**

581 Pollen grains prolate. Almost circular in equatorial view and trilobate circular in polar view. Apertures
582 tricolporate. The exine near the colpi gradually thinned. $P = 24.51 \pm 1.40 \mu\text{m}$, $E = 22.11 \pm 1.05 \mu\text{m}$, $P/E = 1.11$
583 ± 0.06 . The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.67 \pm 0.08 \mu\text{m}$, $H = 0.43$
584 $\pm 0.11 \mu\text{m}$, $D/H = 1.66 \pm 0.51$, $G_s = 0.19 \pm 0.03 \mu\text{m}$, $S_s = 1.56 \pm 0.24 \mu\text{m}$, $G_s/S_s = 0.12 \pm 0.03$.

585 Habitat: bare stony ground, Racomitrium heath, bouldery crests of solifluction terraces, and sometimes
586 hollows between rocks.

587 **28. *Artemisia tanacetifolia* (Table 1, Figs. 11a, 14)**

588 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
589 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 28.38 \pm 0.90 \mu\text{m}$, $E = 27.75 \pm 1.70 \mu\text{m}$,
590 $P/E = 1.03 \pm 0.06$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.71 \pm 0.06$
591 μm , $H = 0.32 \pm 0.04 \mu\text{m}$, $D/H = 2.23 \pm 0.40$, $G_s = 0.30 \pm 0.07 \mu\text{m}$, $S_s = 1.08 \pm 0.16 \mu\text{m}$, $G_s/S_s = 0.29 \pm 0.07$.

592 Habitat: middle and low-altitude areas of forest grasslands, grasslands, meadows, forest edges, open forests,
593 salty grasslands, grass slopes, and brushwood.

594 **29. *Artemisia tournefortiana* (Table 1, Figs. 11b, 14)**

595 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
596 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 20.76 \pm 0.98 \mu\text{m}$, $E = 20.43 \pm 0.83 \mu\text{m}$,
597 $P/E = 1.02 \pm 0.06$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.73 \pm 0.06$
598 μm , $H = 0.42 \pm 0.07 \mu\text{m}$, $D/H = 1.81 \pm 0.33$, $G_s = 0.26 \pm 0.07 \mu\text{m}$, $S_s = 1.25 \pm 0.20 \mu\text{m}$, $G_s/S_s = 0.22 \pm 0.08$.

599 Habitat: widely distributed on hills, terraces, dry flood lands, waste fields, steppes, open forests,
600 semi-marshlands.

601 **30. *Artemisia dracunculus* (Table 1, Figs. 11c, 14)**

602 Pollen grains spheroidal. Almost circular in equatorial view and trilobate circular in polar view. Apertures
603 tricolporate. The exine near the colpi gradually thinned. $P = 22.89 \pm 1.24 \mu\text{m}$, $E = 22.87 \pm 1.32 \mu\text{m}$, $P/E = 1.00$
604 ± 0.05 . The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.68 \pm 0.05 \mu\text{m}$, $H = 0.45$
605 $\pm 0.07 \mu\text{m}$, $D/H = 1.56 \pm 0.31$, $G_s = 0.31 \pm 0.10 \mu\text{m}$, $S_s = 0.92 \pm 0.15 \mu\text{m}$, $G_s/S_s = 0.34 \pm 0.11$.

606 Habitat: dry slopes, steppes, semidesert steppes, forest steppes, forest margins, waste areas, roadsides, terraces,
607 subalpine meadows, meadow steppes, dry river valleys, rocky slopes, saline-alkaline soils; 500-3800 m.

608 **31. *Artemisia japonica* (Table 1, Figs. 12a, 14)**

609 Pollen grains spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar view.
610 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 20.18 \pm 1.28 \mu\text{m}$, $E = 21.23 \pm 1.26 \mu\text{m}$,
611 $P/E = 0.95 \pm 0.05$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.57 \pm 0.05$
612 μm , $H = 0.32 \pm 0.05 \mu\text{m}$, $D/H = 1.80 \pm 0.24$, $G_s = 0.26 \pm 0.05 \mu\text{m}$, $S_s = 1.26 \pm 0.16 \mu\text{m}$, $G_s/S_s = 0.21 \pm 0.04$.

613 Habitat: forest margins, waste areas, shrublands, hills, slopes, roadsides. Low elevations to 3300 m.

614 **32. *Artemisia capillaris* (Table 1, Figs. 12b, 14)**

615 Pollen grains spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar view.
616 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 19.53 \pm 1.09 \mu\text{m}$, $E = 19.64 \pm 1.62 \mu\text{m}$,
617 $P/E = 1.00 \pm 0.08$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.51 \pm 0.06$
618 μm , $H = 0.36 \pm 0.04 \mu\text{m}$, $D/H = 1.44 \pm 0.30$, $G_s = 0.26 \pm 0.04 \mu\text{m}$, $S_s = 1.27 \pm 0.16 \mu\text{m}$, $G_s/S_s = 0.21 \pm 0.05$.

619 Habitat: humid slopes, hills, terraces, roadsides, riverbanks; 100-2700 m.

620 **33. *Artemisia campestris* (Table 1, Figs. 12c, 14)**

621 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
622 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 21.69 \pm 0.85 \mu\text{m}$, $E = 21.26 \pm 0.89 \mu\text{m}$,
623 $P/E = 1.02 \pm 0.07$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.57 \pm 0.09$
624 μm , $H = 0.38 \pm 0.05 \mu\text{m}$, $D/H = 1.53 \pm 0.23$, $G_s = 0.41 \pm 0.09 \mu\text{m}$, $S_s = 1.23 \pm 0.19 \mu\text{m}$, $G_s/S_s = 0.34 \pm 0.08$.

625 Habitat: steppes, waste areas, rocky slopes, dune margins; 300-3100 m.

626 **34. *Kaschgardia brachanthemoides* (Table 1, Figs. 13a, 14)**

627 Pollen grains prolate or spheroidal. Almost circular in equatorial view and trilobate circular in polar view.
628 Apertures tricolporate. The exine near the colpi gradually thinned. $P = 23.26 \pm 1.44 \mu\text{m}$, $E = 22.09 \pm 1.18 \mu\text{m}$,
629 $P/E = 1.06 \pm 0.08$. The exine ornamentation is psilate (LM), spinulate (SEM). Under SEM, $D = 0.55 \pm 0.07$
630 μm , $H = 0.44 \pm 0.05 \mu\text{m}$, $D/H = 1.25 \pm 0.20$, $G_s = 0 \mu\text{m}$, $S_s = 1.75 \pm 0.20 \mu\text{m}$, $G_s/S_s = 0$, Pertorations spacing
631 $(P_s) = 0.47 \pm 0.14 \mu\text{m}$.

632 Habitat: dry mountain valleys, old dry riverbeds; 1000-1500 m.

633 **35. *Ajania pallasiana* (Table 1, Figs. 13b, 14)**

634 Pollen grains spheroidal. Almost circular in equatorial view and trilobate circular in polar view. Apertures
635 tricolporate. The exine near the colpi gradually thinned. $P = 35.16 \pm 2.68 \mu\text{m}$, $E = 35.92 \pm 3.31 \mu\text{m}$, $P/E = 0.98$
636 ± 0.03 . The exine ornamentation spinose. Under SEM, $D = 4.41 \pm 0.35 \mu\text{m}$, $H = 3.47 \pm 0.38 \mu\text{m}$, $D/H = 1.29 \pm$
637 0.21 , $G_s = 0 \mu\text{m}$, $S_s = 7.84 \pm 1.25 \mu\text{m}$, $G_s/S_s = 0$, $P_s = 0.39 \pm 0.12 \mu\text{m}$.

638 Habitat: thickets, mountain slopes, 200-2900 m.

639 **36. *Chrysanthemum indicum* (Table 1, Figs. 13c, 14)**

640 Pollen grains prolate or spheroidal or oblate. Almost circular in equatorial view and trilobate circular in polar
641 view. Apertures tricolporate. The exine near the colpi gradually thinned. $P = 33.54 \pm 1.71 \mu\text{m}$, $E = 34.42 \pm$
642 $2.46 \mu\text{m}$, $P/E = 0.98 \pm 0.08$. The exine ornamentation spinose. Under SEM, $D = 2.94 \pm 0.33 \mu\text{m}$, $H = 3.59 \pm$
643 $0.29 \mu\text{m}$, $D/H = 0.82 \pm 0.10$, $G_s = 0 \mu\text{m}$, $S_s = 7.11 \pm 0.76 \mu\text{m}$, $G_s/S_s = 0$, $P_s = 0.37 \pm 0.13 \mu\text{m}$.

644 Habitat: grasslands on mountain slopes, thickets, wet places by rivers, fields, roadsides, saline places by
645 seashores, under shrubs, 100-2900 m.

648 Note: In the absence of habitat photographs of three species, habitat photographs of species with which they have close
 649 phylogenetic relationships and similar habitats were used in this study instead, i.e. the habitat photograph of *Kaschagara*
 650 *komarovii* was used instead of *Kaschagara brachanthemoides*, the habitat photograph of *Artemisia taurica* for *Artemisia*
 651 *kurramensis* and *Artemisia santonicum* for *Artemisia aralensis*.

652 **Author contributions.** YFW, YFY, TGG conceived the ideas, LLL, BHJ, KQL, and BS collected the
653 literature, LLL extracted and compiled the data, LLL, FQ, and BHJ made the statistical analysis, ML collected
654 pictures, LLL, KQL, and BS drew the figures and tables, LLL, YFW, YFY, LJF, FQ, and GX wrote the first
655 draft of this manuscript, DKF corrected the various versions of the manuscript, while all authors contributed
656 substantially to revisions.

657 **Competing interests.** The authors declare that they have no conflict of interest.

658 **Acknowledgments.** We thank Dr. Jian Yang, Institute of Botany, Chinese Academy of Sciences, for his kind
659 help in drafting graphics and Miss Chen Chen, Mr. Jia-Hao Shen and Mr. Ji-Ye Zheng, Institute of Botany,
660 Chinese Academy of Sciences, for their enthusiastic assistance in providing habitat photographs.

661 **Financial support.** This research was supported by the Strategic Priority Research Program of the Chinese
662 Academy of Sciences (No. XDB26000000), National Natural Science Foundation of China (Nos. 31970223,
663 32070240, and 42077416), and the Chinese Academy of Sciences President's International Fellowship
664 Initiative (No. 2018VBA0016).
