Fig. S1- Fig. S8

Table S1 & Table S2

References

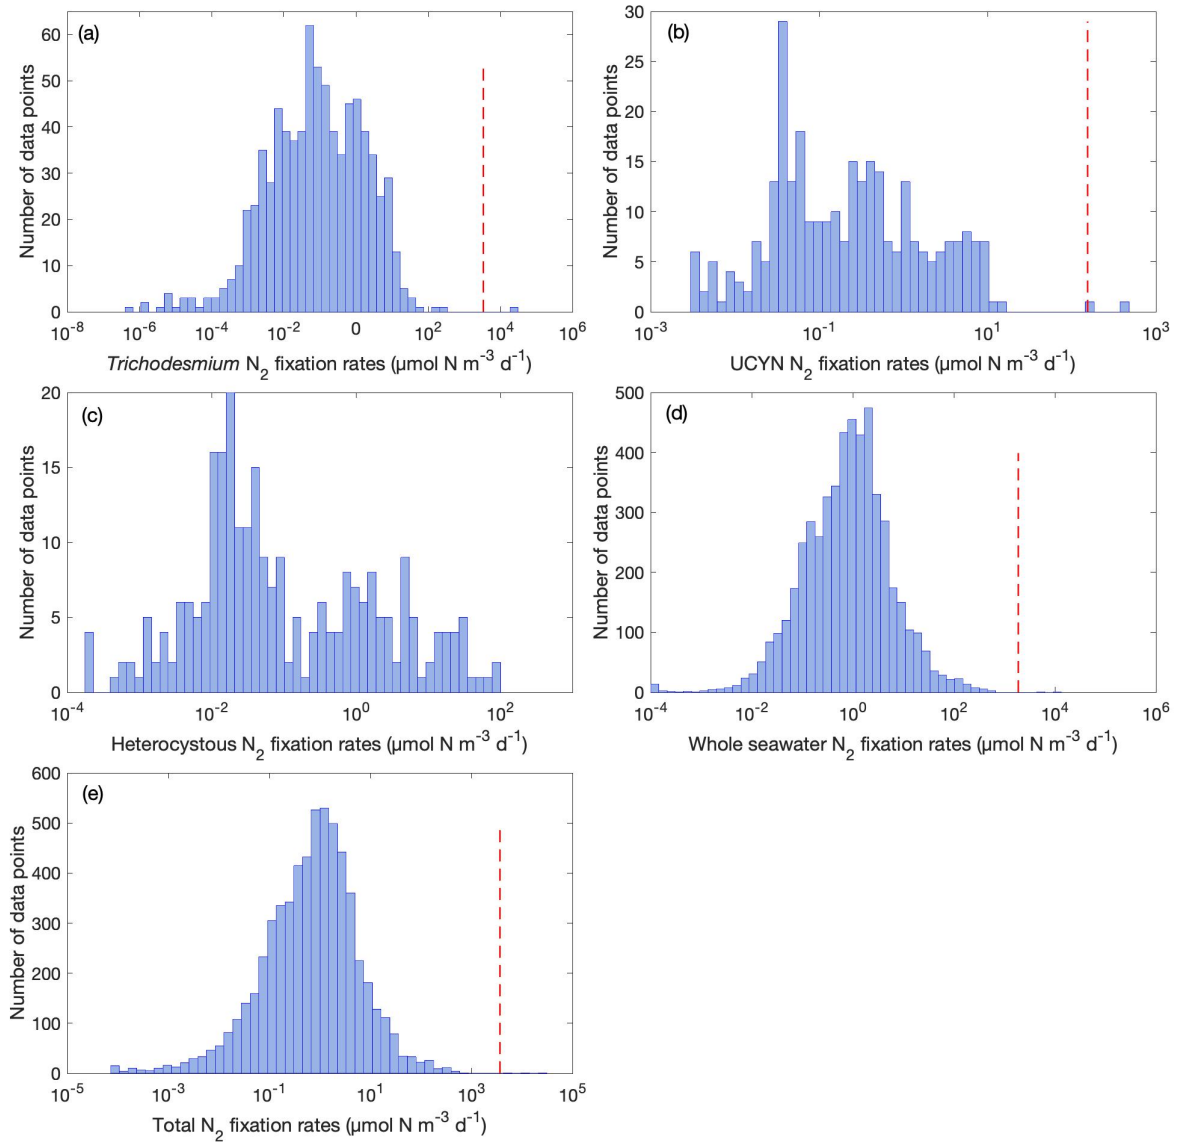

Figure S1. Histogram of volumetric N_2 fixation rates measurements for (a) *Trichodesmium* N_2 fixation, (b) UCYN N_2 fixation, (c) heterocystous N_2 fixation, (d) whole seawater N_2 fixation and (e) total N_2 fixation (non-zero values). Data values are on logarithmic scale. Red line denotes the results of quality control, indicating the critical values above which data are likely outliers.

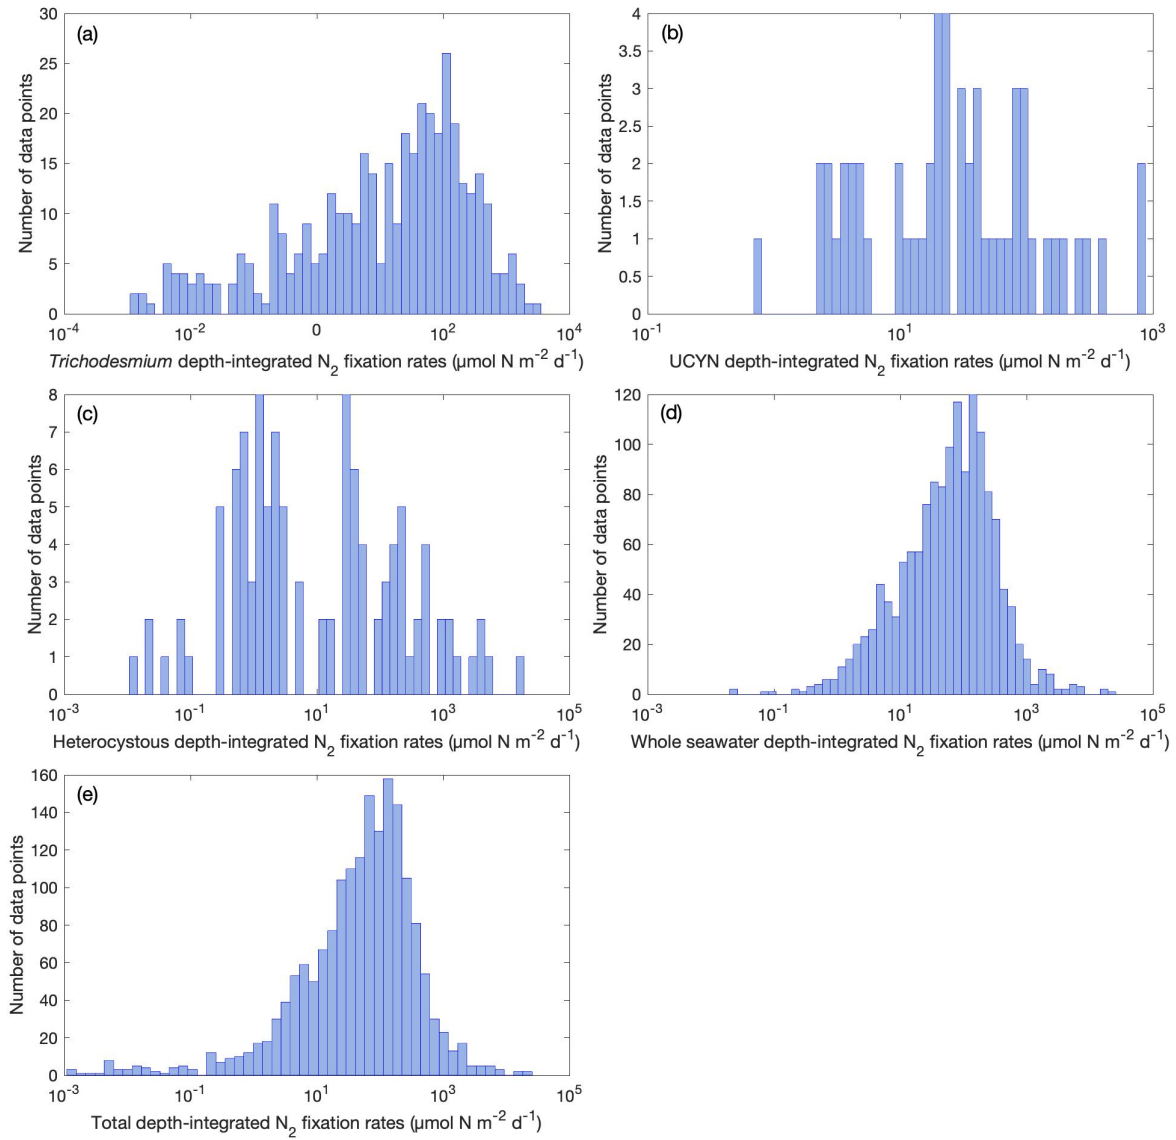

Figure S2. Histogram of depth-integrated N_2 fixation rates measurements for (a) *Trichodesmium* N_2 fixation, (b) UCYN N_2 fixation, (c) heterocystous N_2 fixation, (d) whole seawater N_2 fixation and (e) total N_2 fixation (non-zero values). Data values are on logarithmic scale.

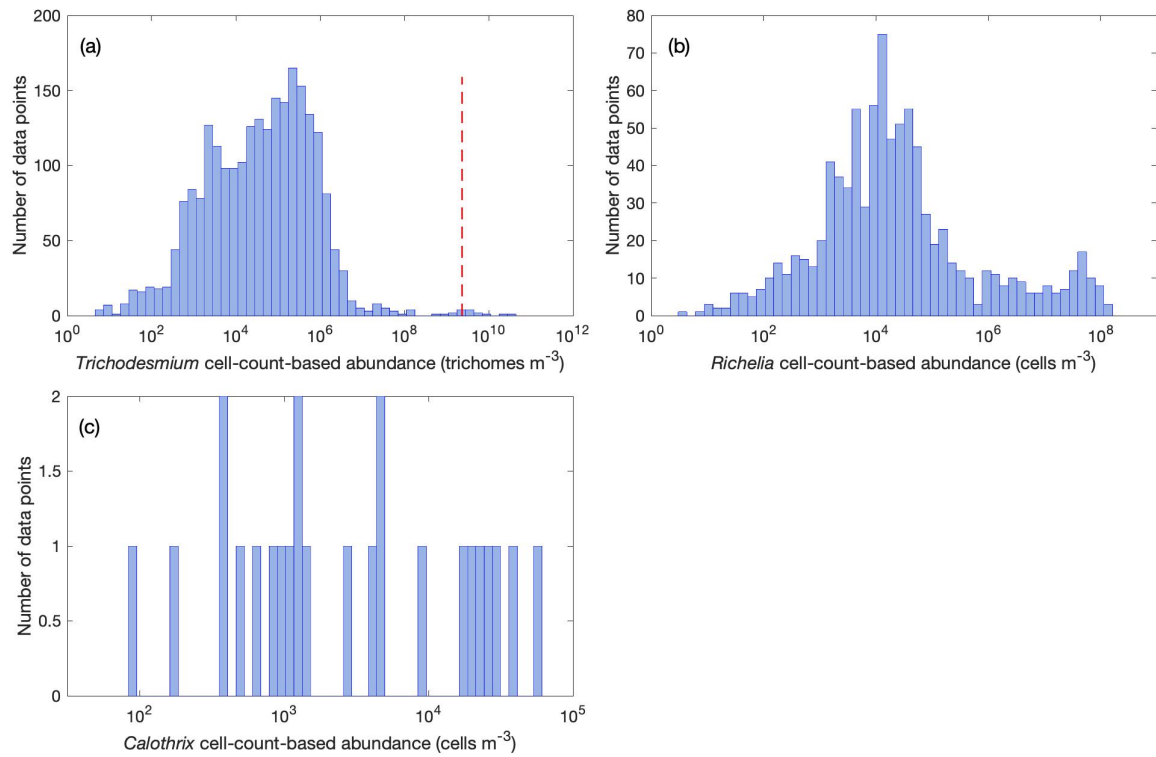

Figure S3. Histogram of volumetric cell counts measurements for (a) *Trichodesmium*, (b) UCYN-A, (c) *Richelia*, and (d) *Calothrix* (non-zero values). Data values are on logarithmic scale. Red line denotes the results of quality control, indicating the critical values above which data are likely outliers.

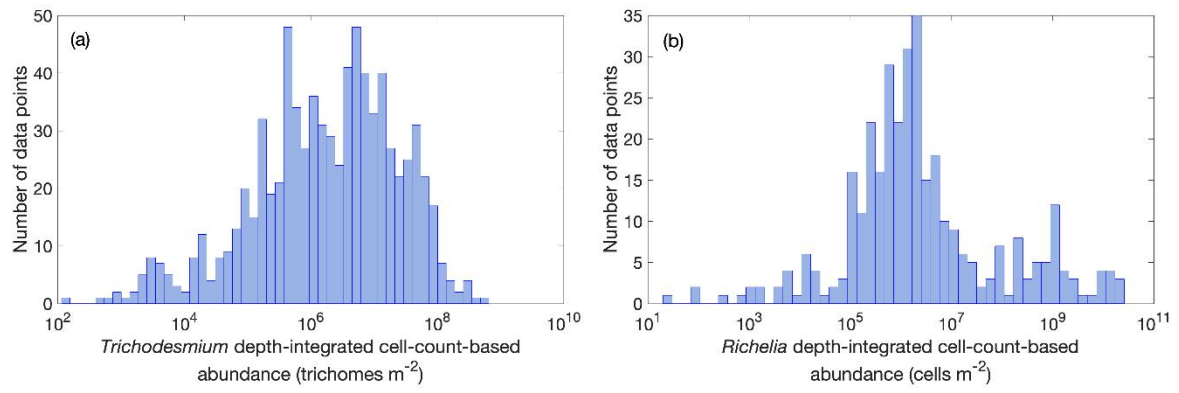

Figure S4. Histogram of depth-integrated cell counts measurements for (a) *Trichodesmium* and (b) *Richelia* (non-zero values). Data values are on logarithmic scale.

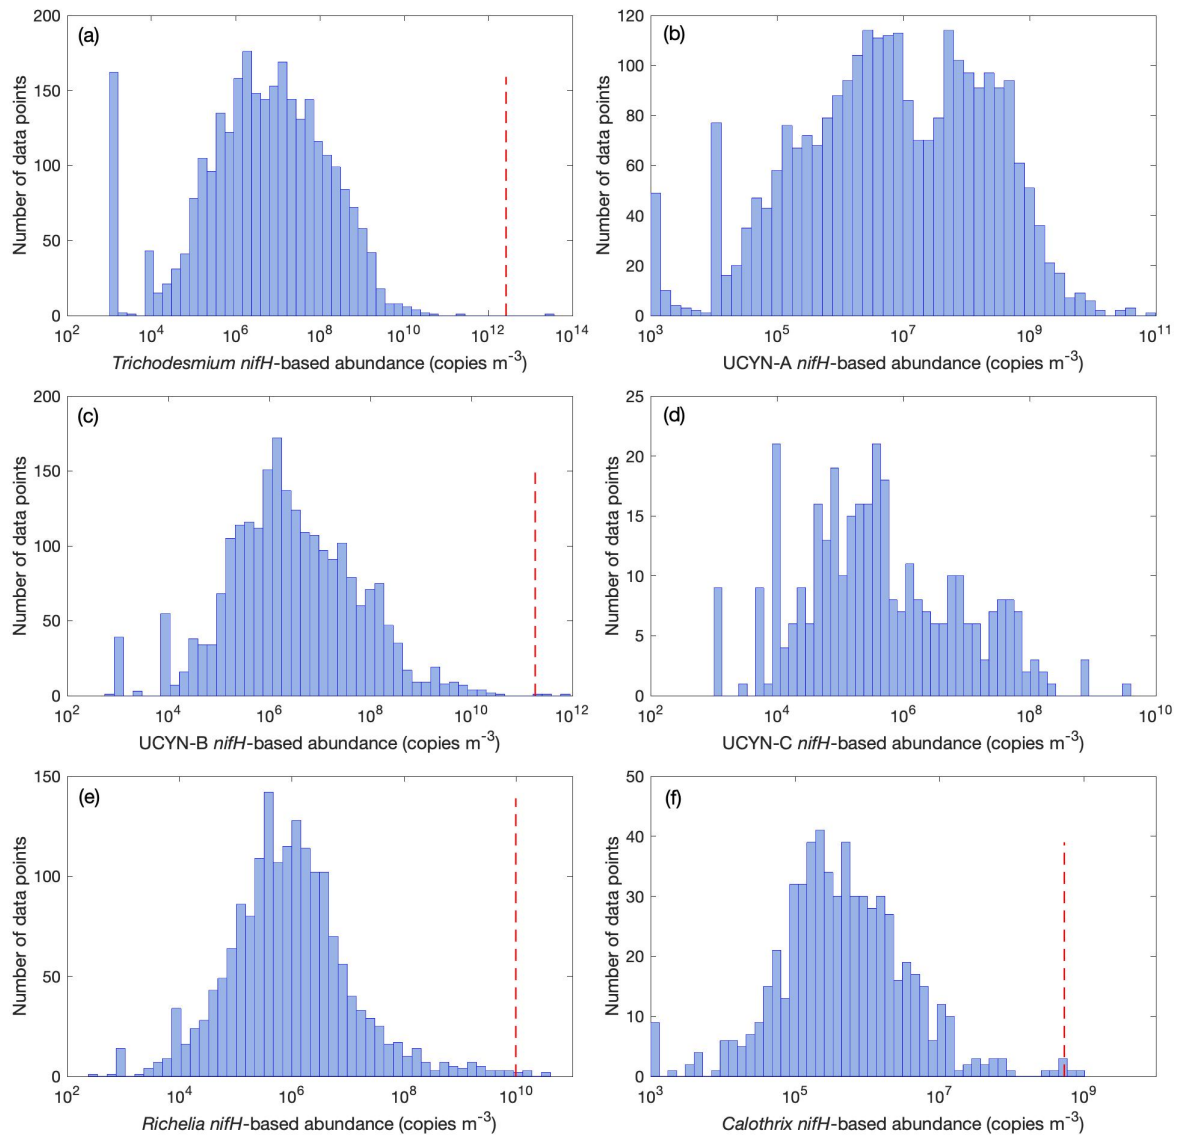

Figure S5. Histogram of volumetric *nifH* qPCR copies measurements for (a) *Trichodesmium*, (b) UCYN-A, (c) UCYN-B, (d) UCYN-C (e) *Richelia*, and (f) *Calothrix* (non-zero values). Data values are on logarithmic scale. Red line denotes the results of quality control, indicating the critical values above which data are likely outliers.

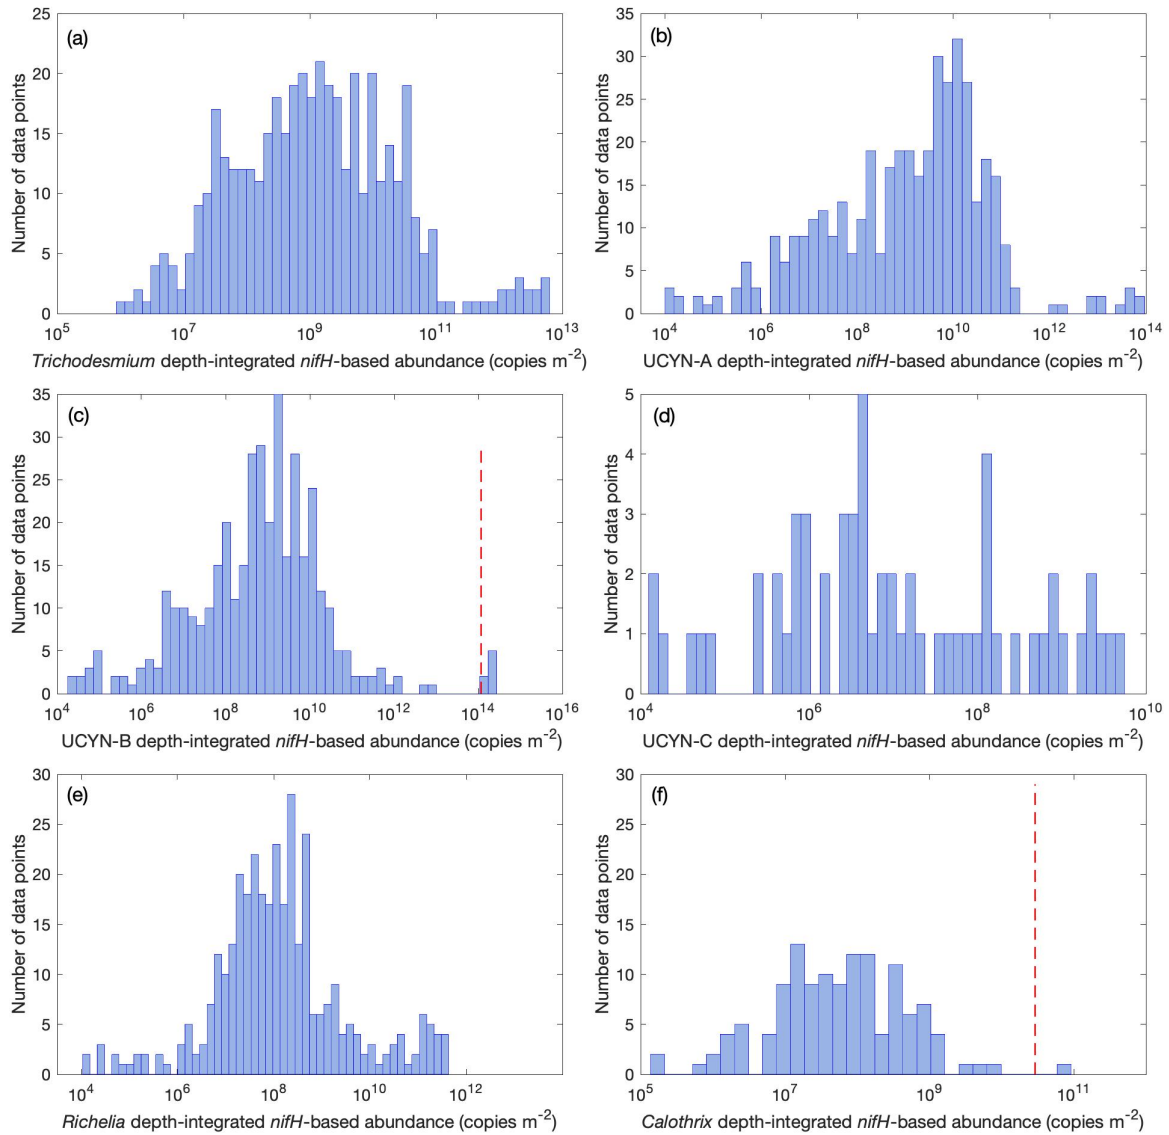

Figure S6. Histogram of depth-integrated *nifH* qPCR copies measurements for (a) *Trichodesmium*, (b) UCYN-A, (c) UCYN-B, (d) UCYN-C (e) *Richelia*, and (f) *Calothrix* (non-zero values). Data values are on logarithmic scale. Red lines denote the results of quality control, indicating the critical values above which data are likely outliers.

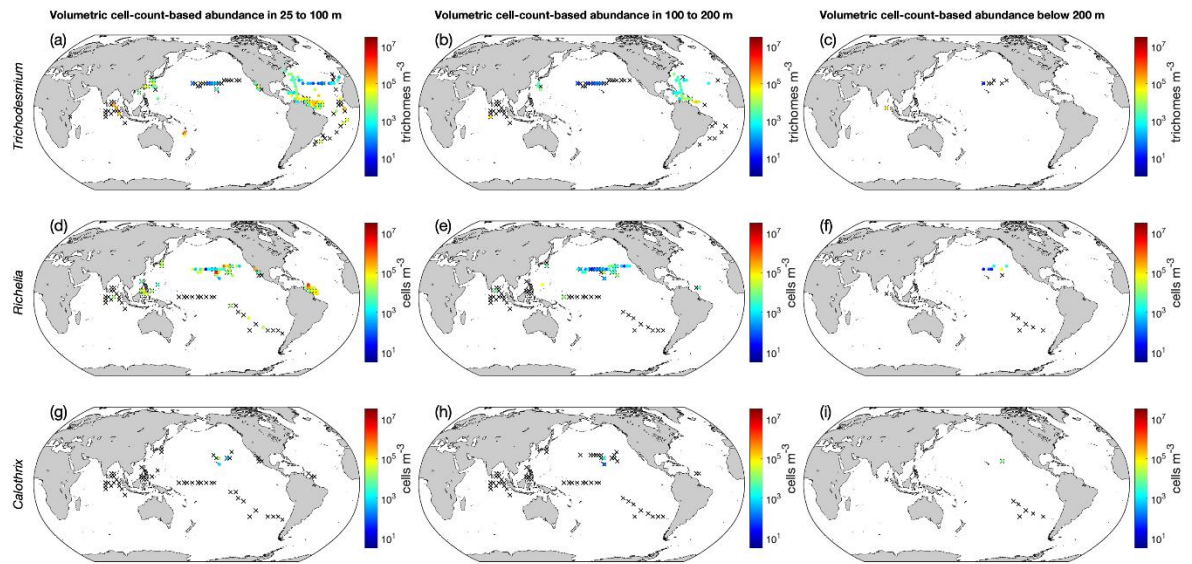

Figure S7. Volumetric cell-count-based abundance of diazotrophic groups. The panels show *Trichodesmium* (a–c), *Richelia* (d–f) and *Calothrix* (g–i) volumetric data in depth ranges of 25–100 m (a, d, g), 100–200 m (b, e, h) and below 200 m (c, f, i). For clear demonstration, data are binned to $3^\circ \times 3^\circ$ and geometric means in each bin are shown. Zero-value data are denoted as black crosses.

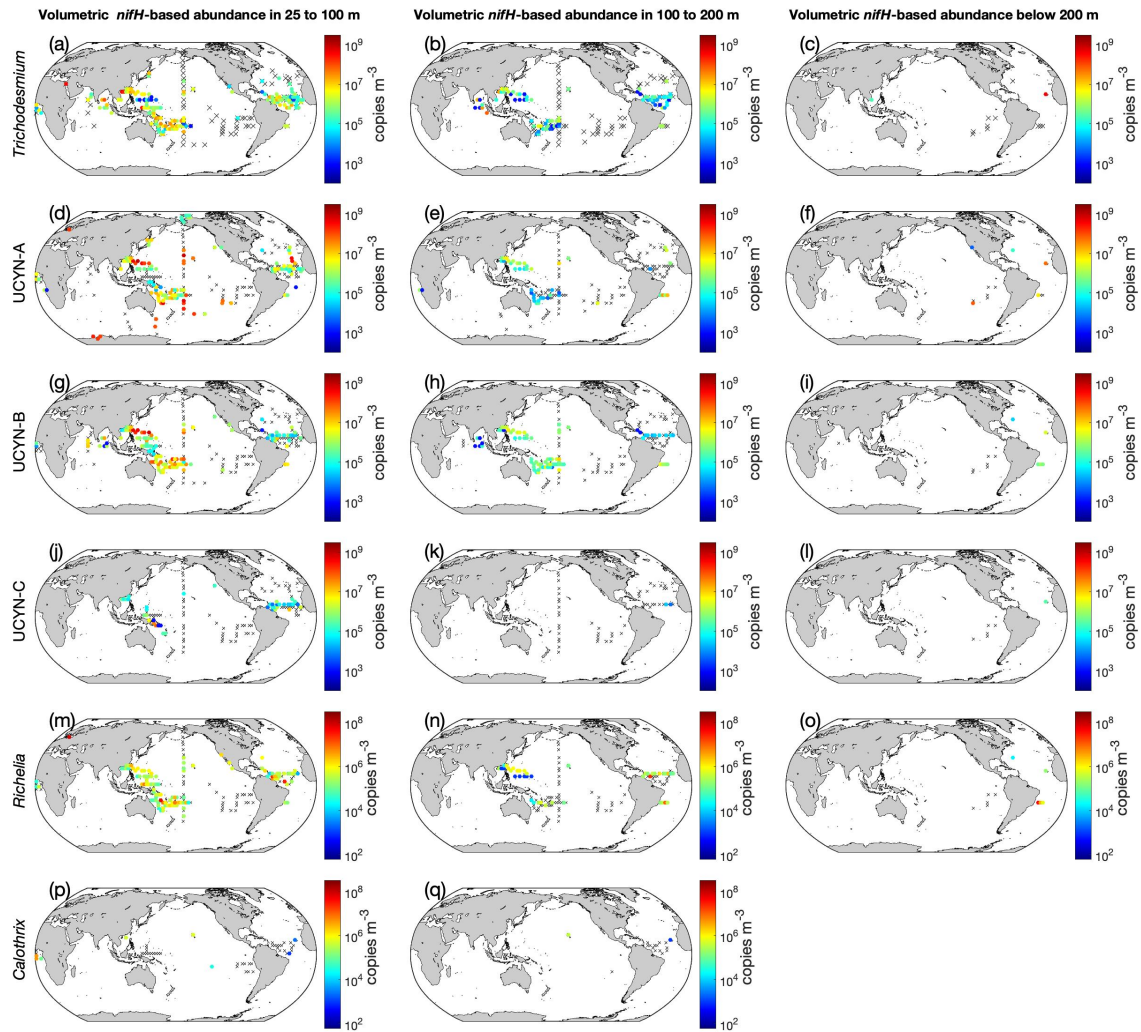

Figure S8. Volumetric *nifH* copies of different diazotrophic groups. The panels show *Trichodesmium* (a–c), UCYN-A (d–f), UCYN-B (g–i), UCYN-C (j–l), *Richelia* (m–o) and *Calothrix* (p, q) volumetric data in depth ranges of 25–100 m (a, d, g, j, m, p), 100–200 m (b, e, h, k, n, q) and below 200 m (c, f, i, l, o). For clear demonstration, data are binned to $3^\circ \times 3^\circ$ and geometric means in each bin are shown. Zero-value data are denoted as black crosses. *Calothrix* volumetric abundance has no data below 200 m.

Table S1. Summary of ratio of *nifH* gene copies to cell numbers in published paper. The numbers in parentheses are ranges of observations.

Reference	Species	Mean cells L ⁻¹	Mean <i>nifH</i> gene copies L ⁻¹	Mean <i>nifH</i> copies cell ⁻¹
White et al. (2018)	<i>Trichodesmium</i>	1,130 (8 – 4,130)	207,000 (593 – 1,460,000)	148
	Het 1-3	190 ^a (78 – 390)	21,200 (148 – 124,000)	76
Lu et al. (2018)	<i>Trichodesmium</i>	221,000 (19,000 – 423,000 ^b)	2,020,000 (42,300 – 40,400,000 ^b)	92
Sargent et al. (2016) ^c	<i>Trichodesmium</i>	(56 – 18,000) ^d	(0 – 270,000) ^d	12
		(0 – 19,000) ^d	(0 – 670,000) ^d	31
Krupke et al. (2013)	UCYN-A	134,000 (1,760 – 819,000)	746,000 (37,200 – 3,690,000)	14

^a Heterocystous cell numbers were reported, here total cell numbers were used (heterocystous cell numbers multiply a factor of 6 assuming one filament contains one heterocystous cell and five vegetative cells).

^b data collected during *Trichodesmium* bloom.

^c two cruises in different seasons.

^d no average data reported.

Table S2. Biomass conversion factors for heterocystous diazotroph-diatom associations. The numbers in parentheses are ranged used in the estimation.

Species	Diatom		Vegetative	Heterocysts	Number of	Diazotrophic	Diazotrophic	Total DDA	DDA Biomass
	Biovolume (μm^3)	Biomass ^a (pg C cell ⁻¹)	cells per heterocyst	per DDA	diazotrophic cells per DDA ^b	cell biomass conversion (pg C cell ⁻¹)	biomass (pg C DDA ⁻¹)	biomass ^c (pg C DDA ⁻¹)	Conversion factor (pg C heterocyst ⁻¹)
<i>Richelia- Hemiaulus</i>	10800 (7050–20900)	418 (287–748)		2	12 (8–22)		144 (16–1760)	562 (303–2508)	281 (152–1254)
<i>Richelia- Rhizosolenia</i>	57100 (439–188000)	1814 (25–5184)	5 (3–10)	5	30 (20–55)	12 (2–80)	360 (40–4400)	2174 (65–9584)	430 (13–1916)
<i>Calothrix- Chaetoceros</i>	1480 (300–4630)	73 (18–288)		2	12 (8–22)		144 (40–440)	217 (58–728)	110 (29–364)
				5	30 (20–55)	12 (5–20)	360 (100–1100)	433 (118–1388)	90 (24–278)

^a Based on an empirical relationship (Menden-Deuer and Lessard, 2000) : biomass = $0.117 \times \text{biovolume}^{0.881}$.

^b (1 + number of vegetative cells) \times number of heterocyst.

^c Diatom biomass + diazotrophic biomass.
