105°W 100°W 95°W 90°W 85°W 80°W 75°W
 Figure S1. Locations of gust speed observational sites used in the study. There are 4,260 sites, 3,954 of which are over land (red points), while the rest are over the ocean or lakes (blue points). We use the Advanced
 Research Weather Research and Forecasting (WRF) Preprocess System (WPS) to generate a 4-km land cover map to determine the land type associated with each observational site. Light-yellow shading denotes an elevation greater than 1000 m; light-gray shading denotes an elevation between 400 m and 1000 m; and smoke-white shading denotes an elevation less than 400 m. Background white is for the ocean and lakes.

211 2 3 4 5 6 7 8 9 10 h1 2 3 4 5 6 7 8 9 10 h22Figure S2. Same as Figure 13, but the frequencies of damaging gust occurrences from mesoscale convective23system (MCS), derecho, and derecho feature (DF) are shown in (b), (c), and (d) instead of fractions. Non-

24 derecho MCS events overlapping with tropical cyclones (TCs) are excluded in (b).

26
27 Figure S3. Same as Figure 7 but for an MCS that occurred on 1-2 August 2013. The automated detection

- algorithm falsely classifies the MCS as a derecho due to the false identification of bow echoes by the
- 29 segmentation CNN. The figure title refers to the derecho timing range.

34 refer to bow echoes labeled manually.

36
37 Figure S5. The annual number of gust speed observational sites used in the derecho identification between
38 2004 and 2021.

40 105°W 100°W 95°W 90°W 85°W 80°W 75°W
41 Figure S6. The derecho paths (black lines) during their DF periods. Each blue dot denotes the location of a derecho at the beginning of its DF period, while the corresponding red dot refers to the location at the end of

43 the DF period. The location is calculated as the mean latitude and longitude of all grid cells within the DF area

44 and covered by the derecho at the given time. Only grid cells with $Z_{Hmax} \ge 20$ dBZ are considered in the

45 calculation. If there are no grid cells with $Z_{Hmax} \ge 20$ dBZ, we will move to the next hour (for blue dots) or the 46 previous hour (for red dots) until we find grid cells with $Z_{Hmax} \ge 20$ dBZ.

49 Figure S7. Same as Figure 10 but for a sensitivity test with the gust swath calculation based on \geq 10 sites with damaging gusts. Using the updated criteria, 19 derechos are identified.

- Figure S8. (a) Relative contributions of derecho-associated to MCS-associated damaging gust occurrences
- 52 53 54 between 2004 and 2021 at weather stations over the United States east of the Rocky Mountains. (b) is the same 55 as (a) but for relative contributions of DF-associated to derecho-associated damaging gust occurrences. We
- 56 exclude non-derecho MCS events overlapping with TCs in (a).

59

Figure S9. PDFs of land gust speeds associated with MCSs, derechos, and DFs in the United States east of the Rocky Mountains. We exclude non-derecho MCS events overlapping with TCs.

20150911T02:00:00Z - 20150911T08:00:00Z

 - Figure S10. Same as Figure 14 but for the spatial evolutions during the derecho DF period. The figure title
- refers to the DF timing range.
